#### Abstract

In this paper we combine features of dynamic-epistemic logics with the spatial logics in order to obtain a decidable, fully axiomatized logic for expressing information flow in distributed multi-agent systems. Thus, Dynamic Epistemic Spatial Logic is as an extension of Hennessy-Milner logic with spatial and epistemic operators.

## 1 Introduction

The development of computer networks came with new paradigms of computation by proposing the concurrent distributed computing systems, which are not only sequential, goal-directed, deterministic or hierarchical systems, but represent programs/processors running in parallel and organized in networks of subsystems, each subsystem having its own identity. The subsystems interact, collaborate, communicate and interrupt each other.

Underlying this new paradigm is the assumption that each part of such a system has its own identity, which persists through time. We shall call these parts agents. Hence the agents are separate and independently observable units of behavior and computation. They evolve in a given environment, following some primitive rules, their evolution influencing the structure of the whole (multi-agent) system. The main feature of the agents is their ability to communicate, that is to exchange information inside their environment.

Multi-agent systems are extremely complex. The success in dealing with this complexity depends on the mathematical model we choose to abstract the system. Further we focus on two major paradigms.

## To be is to behave

The first paradigm is proposed by Process Algebra [3], that abstracts the agents of the system, on the level of their behavior, and using some algebraic calculi and operational semantics [30] describes the evolution of the whole system. Inspired by $\lambda$-calculus and deeply related with the programming languages, this paradigm succeeds in modelling complex computational scenarios. Further, as the behavior of a concurrent system is, mainly, a succession of affine states in (possibly branching) time, was considered the possibility of applying modal (especially temporal) logics for specifying properties of the systems we modelled.

In studying security problems, for example, we may want to be able to specify systems composed by agents that deal with fresh or secret resources. We may want to express properties such as "the agent has the key", "eventually the agent crosses the firewall" or "there is always at most one agent here able to decrypt the message".

[^0]In systems biology [10] we need to handle big complex systems having extreme dimensions and variable environments. We need to express properties such as "somewhere there is a virus", "if the virus will meet the macrophage cell then it will be engulfed and eventually destroyed", or "the presence of the protein $x$ will stimulate the reaction $X$ ", etc.

Hennessy-Milner logic [24] is one of the first modal logics that proposes some modal operators, indexed by actions, to describe the behavior of the systems in CCS. The idea was further developed in combination with temporal operators [31] or applied to other calculi $[29,16,18]$. Latter, Mads Dam introduced a tensor that can express properties of modularity in the system [17], i.e. it can identify subsystems of a system. All these logics are characterized by their extensional nature, meaning that they cannot distinguish between processes that behave the same, even if these processes are different.

An increased degree of expressiveness is necessary if we want to specify and to reason about notions such as locations, resources, independence, distribution, connectivity and freshness. The specific applications of mobile computing call for properties that hold at particular locations, and it becomes natural to consider spatial modalities for expressing properties that hold at a certain location, at some locations or at every location. Thus, Spatial logics [7, 6, 12] propose, in addition to the modal temporal operators, some modal spatial operators such as the parallel operator $\phi \mid \psi$ (meaning that the current process can be split into a parallel composition $Q \mid R$ of a process $Q$ satisfying $\phi$ and a process $R$ satisfying $\psi$ ), and its adjoint - the guarantee operator $\phi \triangleright \psi$, or location operator ${ }^{1} n[\phi]$ (meaning that the current process is an ambient $n[P]$ and the process $P$ satisfies $\phi$ ), etc. A formula in a spatial logic describes a property of a particular part of the system at a particular time. These spatial modalities have an intensional flavor, the properties they express being invariant only for simple spatial rearrangements of the system.

As the main reason for introducing spatial logics was to provide appropriate techniques for specification and model checking concurrent distributed systems, most of the work done in this field points to decidability problems. We briefly present hereafter the (un)decidability results for spatial logics, proved in [8], which motivated our work.

Definition 1.1. Consider the fragment of CCS generated by the next syntax, where $\mathbb{A}$ is a denumerable set of actions and $\alpha \in \mathbb{A}$ :

$$
P::=0|\alpha . P| P \mid P
$$

Hereafter this calculus ${ }^{2}$ is the object of our paper. We will use $\alpha, \beta$ to range over $\mathbb{A}$ and we will denote by $\mathfrak{P}$ the class of processes.

For it, in [8], were considered two spatial logics:

- $\mathcal{L}_{\text {spat }}$ given by the syntax

$$
\phi::=\top|0| \phi_{1} \wedge \phi_{2}|\neg \phi| \phi_{1}\left|\phi_{2}\right| \phi_{1} \triangleright \phi_{2} \mid \diamond \phi
$$

- $\mathcal{L}_{\text {mod }}$ given, over an infinite set of variables $X \ni x$, by the syntax

$$
\phi::=\top|0| \phi_{1} \wedge \phi_{2}|\neg \phi| \phi_{1}\left|\phi_{2}\right| \phi_{1} \triangleright \phi_{2}|\diamond \phi|\langle x\rangle \phi \mid \exists x . \phi
$$

A valuation is a mapping from a finite subset of $X$ to $\mathbb{A}$. For any valuation $v$, we write $v\{x \leftarrow \alpha\}$ for the valuation $v^{\prime}$ such that $v^{\prime}(x)=\alpha$, and $v^{\prime}(y)=v(y)$ if $y \neq x$.
The semantics for the two spatial logics, defined by the satisfaction relation $P, v \models_{M} \phi$ where $P$ is a process, $M$ is a set of processes that contains $P, \phi$ a formula, and $v$ is a valuation for the free variables of $\phi$, is presented in Table 1.

[^1]```
\(P, v=_{M} \top\) for any process \(P\)
\(P, v \neq_{M} \neg \phi\) iff \(P, v \not \models \phi\)
\(P, v \models_{M} \phi \wedge \psi\) iff \(P, v \models_{M} \phi\) and \(P, v \models_{M} \psi\)
\(P, v \neq{ }_{M} 0\) iff \(P \equiv 0\)
\(P, v\left|=_{M} \phi\right| \psi\) iff \(P \equiv Q \mid R, Q, v \models_{M} \phi\) and \(R, v=_{M} \psi\)
\(P, v=_{M} \phi \triangleright \psi\) iff for any process \(Q, v \models_{M} \phi\) we have \(P \mid Q, v=_{M} \psi\)
\(P, v \not \models_{M} \exists x . \phi\) iff \(\exists \alpha \in \mathbb{A}\) such that \(P,(v\{x \leftarrow \alpha\}) \models_{M} \phi\)
\(P, v=_{M}\langle x\rangle \phi\) iff \(\exists Q . P \xrightarrow{v(x)} Q\) and \(Q, v=_{M} \phi\)
```

Table 1: Semantics of Spatial Logics

In [8] it is proved that $\mathcal{L}_{\text {spat }}$ can encode $\mathcal{L}_{\text {mod }}$, hence they are equally expressive. Then it is proved that model-checking and validity/satisfiability checking for $\mathcal{L}_{\text {spat }}$ with respect to this finite fragment of CCS are all undecidable. But $\mathcal{L}_{\text {spat }}$ is the core of all Spatial Logics.

Thus it was proved that the basic spatial operators, in combination with temporal operators, generate undecidable logics $[8,14,13]$, even against small finite pieces of CCS. This means that we cannot solve most of the problems concerning satisfiability, validity and model checking. The situation is caused, mainly, by the presence of the guarantee operator, which acts as a universal quantifier over the class of processes. The reason for introducing such an operator was to have possibility to specify not only local, but global properties of the system. Without it spatial logics are not enough expressive for fulfilling the requirements of relevant applications.

However, some decidable sublogics have been investigated [5, 9, 28, 27] and some modelchecking algorithms exist for them. In the light of these results we have two alternatives for avoiding undecidability: either we choose a logic based on a static calculus [9], thus the logic cannot specify properties of our system in evolution, or we choose a dynamic calculus, but we have to avoid the use of a guarantee operator [5, 28], hence we can express only local properties of the system. The latter alternative is useful only if our system is an isolated one (there is no upper-system for it) and we have a full description of it. In this sense the possible applications are quite limited. In problems such as those proposed by systems biology, for example, it is not acceptable, as biological systems are almost always subsystems of bigger ones with which they interact. Very often we do not know too much about these upper systems, or we cannot decide how far up we should go with modeling the systems in order to obtain the information we are looking for.

Concluding, though expressive and useful, most of the spatial logics proved to be undecidable, even in the absence of quantifiers. Unlike in static spatial logics, the composition adjunct adds to the expressiveness of the logic, so that adjunct elimination is not possible for dynamic spatial logics, even quantifier-free [8]. To the best of our knowledge, no alternative operator, to replace the guarantee one in order to express global properties and still ensuring decidability, has been studied. We propose further such an alternative.

## To be is to know

The other paradigm of modelling multi-agent systems comes from logics and philosophy: reasoning about systems in terms of knowledge [19]. At the beginning, the interest was to find inherent properties of knowledge and related concepts. More recently, the computer scientists have become increasingly interested in reasoning about knowledge. Within computer science, reasoning about knowledge plays an extremely important role in contemporary theories of (intelligent) agents and it has been proved to be useful in modelling and understanding complex communication-based systems.

In the transition from human agents to (artificial) intelligent agents and latter to the multiagent system in the most general sense, the meaning of the term "knowledge" evolved. It was originally used in its ordinary language meaning: to say that an agent knows a sentence either means that it consciously assents to it, or that it immediately sees it to be true when the question is presented. Latter, in the new interpretation, the knowledge of the agent is understood as the sum of actions the agent may take as a function of its local state in a given environment. Thus the agent knows its protocol in a given system. In this context we have an external notion of knowledge in the sense that there is no notion of the agent computing his knowledge and no requirement that the agent being able to answer questions based on his knowledge.

Epistemic/doxastic logics [19] formalize, in a direct manner, notions of knowledge, or belief, possessed by an agent, or a group of agents, using modalities like $K_{A} \phi-A$ knows $\phi, \square_{A} \phi-A$ justifiably believes that $\phi$, or $C k \phi$ - all the agents knows $\phi$ ( $\phi$ is a common knowledge). These logics supports Kripke-model based semantics, each basic modality being associated with a binary accessibility relation in these models. Thus for each epistemic agent $A$ we devise an accessibility relation $\xrightarrow{A}$, called indistinguishability relation for $A$, expressing the agent's uncertainty about the current state. The states $s^{\prime}$ such that $s \xrightarrow{A} s^{\prime}$ are the epistemic alternatives of $s$ to agent $A$ : if the current state is $s, A$ thinks that any of the alternatives $s^{\prime}$ may be the current state. These logics have been extensively studied and applied to multi-agent systems.

Suppose that we have a group consisting of $n$ agents. Then we augment the language of propositional logic by $n$ knowledge operators $K_{1}, \ldots K_{n}$ (one for each agent), and form formulas in the obvious way. A statement like $K_{1} \phi$ is read "agent 1 knows $\phi$ ". The state that agent 1 knows that agent 2 knows $\phi$ is formalized by $K_{1} K_{2} \phi$. A formula like $K_{1} \phi \wedge K_{1}(\phi \rightarrow \psi) \rightarrow K_{1} \psi$ is interpreted: "if agent 1 knows $\alpha$ and $\alpha \rightarrow \beta$ then it knows $\beta$ ".

Definition 1.2 (The language of epistemic logic). Let $\Phi$ be a nonempty, countable set of atomic formulae and $\mathfrak{S}=\{1, \ldots n\}$ a set of agents. We introduce the language of epistemic logic as the least set $\mathcal{F}^{\mathfrak{G}}$ of formulas such that:

$$
\begin{array}{ll}
\text { 1. Atom } \subseteq \mathcal{F}^{\mathfrak{S}} & \text { 3. if } \phi \in \mathcal{F}^{\mathfrak{S}} \text { then } \neg \phi \in \mathcal{F}^{\mathfrak{S}} \\
\text { 2. if } \phi, \psi \in \mathcal{F}^{\mathfrak{S}} \text { then } \phi \wedge \psi \in \mathcal{F}^{\mathfrak{S}} & \text { 4. if } \alpha \in \mathcal{F}^{\mathfrak{S}} \text { and } i \in \mathfrak{S} \text { then } K_{i} \phi \in \mathcal{F}^{\mathfrak{S}}
\end{array}
$$

One approach to defining semantics for epistemic logic is in terms of possible worlds. The intuitive idea behind the possible worlds approach is that an agent can build different models of the world using some suitable language. He usually does not know exactly which one of the models is the right model of the world. However, he does not consider all these models equally possible. Some world models are incompatible with his current information state, so he can exclude these incompatible models from the set of his possible world models. Only a subset of the set of all (logically) possible models are considered possible by the agent.

The set of worlds considered possible by an agent $i$ depends on the "actual world", or the agent's actual state of information. This dependency can be captured formally by introducing a binary relation, say $\mathcal{R}_{i}$, on the set of possible worlds. To express the idea that for agent $i$, the world $t$ is compatible with his information state when he is in the world $s$, we require that the relation $\mathcal{R}_{i}$ holds between $s$ and $t$. One says that $t$ is an epistemic alternative to $s$ (for agent $i)$. If a sentence $\phi$ is true in all worlds which agent $i$ considers possible then we say that this agent knows $\phi$.

Formally, the concept of models is defined in terms of Kripke structures, as follows:
Definition 1.3 (Semantics of Epistemic Logic). A model $\mathcal{M}$ for the language $\mathcal{F}^{\mathfrak{G}}$ is a Kripke structure for the agents in $\mathfrak{S}$ over $\Phi$, i.e. is a structure $\mathcal{M}=\left(S, \pi,\left(\mathcal{R}_{i}\right)_{i \in \mathfrak{S}}\right)$ where

- $S$ is a nonempty set of possible worlds (states)
- $\pi$ is an interpretation which associates with each state in $S$ a truth assignment to the primitive propositions in $\Phi$ (i.e. for $s \in S, \pi(s): \Phi \rightarrow\{\top, \perp\}$ )
- $\mathcal{R}_{i}$ is a binary relation on $S$ associated to the agent $i \in \mathfrak{S}$

The satisfaction relation $\models$ is defined recursively on $\mathcal{F}^{\mathfrak{G}}$ as follows:

- $\mathcal{M}, s=p$ iff $\pi(s)(p)=\top$ for any $p \in \Phi$
- $\mathcal{M}, s \vDash \neg \phi$ iff $\mathcal{M}, s \not \vDash \phi$
- $\mathcal{M}, s \models \phi \wedge \psi$ iff $\mathcal{M}, s \models \phi$ and $\mathcal{M}, s \models \psi$
- $\mathcal{M}, s=K_{i} \phi$ iff for all $t \in S$ such that $s \mathcal{R}_{i} t$ we have $\mathcal{M}, t=\phi$

A modal epistemic logic for the agents in $\mathfrak{S}$ is obtained by joining together $n$ modal logics [4], one for each agent in $\mathfrak{S}$. It is usually assumed that the agents are homogeneous, i.e., they can be described by the same logic. So an epistemic logic for $n$ agents consists of $n$ copies of a certain modal logic. Such a system over $\mathfrak{S}$ will be denoted by the same name as the modal system, but with the superscript $\mathfrak{S}$.

Definition 1.4 (Modal epistemic logic $K^{\mathfrak{G}}$ ). The modal epistemic $\operatorname{logic} K^{\mathfrak{G}}$ is the logic specified by the following axioms and rules of inference, where $i \in \mathfrak{S}$ :
(PC): All propositional tautologies.
(K): $\vdash K_{i} \phi \wedge K_{i}(\phi \rightarrow \psi) \rightarrow K_{i} \psi$
(MP): Modus ponens: if $\vdash \phi$ and $\vdash \phi \rightarrow \psi$ then $\vdash \psi$
(NEC): Necessity: if $\vdash \phi$ then $\vdash K_{i} \phi$
Stronger logics can be obtained by adding additional principles, which express the desirable properties of the concept of knowledge, to the basic system $K^{\mathfrak{G}}$. The following properties are often considered:

$$
\begin{array}{ll}
\text { (T): Knowledge axiom: } \vdash K_{i} \phi \rightarrow \phi & \text { (4): Positive introspection: } \vdash K_{i} \phi \rightarrow K_{i} K_{i} \phi \\
\text { (D): Consistency axiom: } \vdash K_{i} \phi \rightarrow \neg K_{i} \neg \phi & \text { (5): Negative introspection: } \vdash \neg K_{i} \phi \rightarrow K_{i} \neg K_{i} \phi
\end{array}
$$

The formula ( T ) states that knowledge must be true. In the doxastic logic this axiom is taken to be the major one distinguishing knowledge from belief. For that reason (T) is called the Knowledge Axiom or the Truth Axiom (for knowledge). Systems containing the schema (T) (such as S4 and S5) are then called logics of knowledge, and logics without the schema (T) are called logics of belief.

The property (D), called the Consistency Axiom, requires that agents be consistent in their knowledge: they do not know both a formula and its negation. Generally, (D) is a weaker condition than (T).

The properties (4) and (5) are called positive and negative introspection axioms, respectively. They say that an agent is aware of what he knows and what he does not know. Their converses, i.e., the formulae $\vdash K_{i} K_{i} \phi \rightarrow K_{i} \phi$ and $\vdash K_{i} \neg K_{i} \phi \rightarrow \neg K_{i} \phi$, are instances of the schema (T). Taking (4) and (5) together with their converses we have $\vdash K_{i} K_{i} \phi \leftrightarrow K_{i} \phi$ and $\vdash K_{i} \neg K_{i} \phi \leftrightarrow$ $\neg K_{i} \phi$, which allow to reduce multiple knowledge operators to a single (positive or negative) knowledge operator.
The commonly used epistemic logics are specified as follows:

- $T^{\mathfrak{G}}$ is $K^{\mathfrak{G}}$ plus (T)
- $S 4^{\mathfrak{G}}$ is $T^{\mathfrak{G}}$ plus (4)
- $S 5^{\mathfrak{G}}$ is $S 4^{\mathfrak{G}}$ plus (5)
$\bullet K D^{\mathfrak{G}}$ is $K^{\mathfrak{G}}$ plus (D) • $K D 4^{\mathscr{G}}$ is $K D^{\mathfrak{G}}$ plus (4) • $K D 45^{\mathfrak{G}}$ is $K D 4^{\mathfrak{S}}$ plus (5)

The following theorem summarizes some completeness and decidability results for modal epistemic logic [15, 25, 21, 22].

## Theorem 1.1 (Completeness and decidability of epistemic logics).

1. $K^{\mathfrak{S}}$ describes the class of models with accessibility relations indexed by elements in $\mathfrak{S}$.
2. $T^{\mathfrak{G}}$ describes the class of models with reflexive accessibility relations.
3. $S 4^{\mathfrak{G}}$ describes the class of models with reflexive and transitive accessibility relations.
4. $S 5^{\mathfrak{S}}$ describes the class of models with equivalence relations as accessibility relations.
5. $K D^{\mathfrak{G}}$ describes the class of models with serial accessibility relations.
6. $K D 4^{\mathfrak{S}}$ describes the class of models with serial and transitive accessibility relations.
7. KD45 ${ }^{\mathfrak{G}}$ describes the class of models with serial, transitive and Euclidean accessibility relations.
8. $K^{\mathfrak{S}}, T^{\mathfrak{S}}, S 4^{\mathfrak{S}}, S 5^{\mathfrak{S}}, K D^{\mathfrak{S}}, K D 4^{\mathfrak{S}}$, and $K D 45^{\mathfrak{S}}$ are all decidable.

Dynamic logics [23] are closer to process calculi, in that they have names for programs (actions) and operators to combine them. Accessibility relations are interpreted as transitions induced by programs, and a dynamic modality $[\pi] \phi$ captures the weakest precondition of such a program w.r.t. a given post-specification $\phi$. Modalities in a dynamic logic form an algebraical structure: programs are built using basic program constructors such as sequential composition $\pi . \pi^{\prime}$ or iteration $\pi^{*}$.

By mixing dynamic and epistemic formalisms Dynamic Epistemic Logics have been developed $[1,2,26,32,33,34]$, aiming to capture properties of evolving knowledge and of beliefchanging actions, such as communication. These logics combine a rich expressivity with low complexity ensuring decidability and complete axiomatizations.

## Our approach

The two paradigms of modelling concurrent distributed systems - the process algebraical paradigm with the epistemic-doxastic one - were developed in parallel, but to our knowledge, there has been no unified paradigm. We propose such a paradigm in this paper, used for constructing a new logic for concurrency completely axiomatized and decidable. The main idea is to combine the features of spatial logics with the epistemic logics thus obtaining a special type of dynamic epistemic logic equipped with spatial operators. We call it Dynamic Epistemic Spatial Logic.

More concretely, our logic extends Hennessy-Milner logic with the parallel operator (hence it is a spatial logic) and epistemic operators. The role of the epistemic operators is to do most of the job of the guarantee operator while maintaining decidability. In our logics the epistemic agents are related (identified) with processes. Thus $K_{P} \phi$ holds, the agent related with $P$ knows $\phi$, iff $\phi$ is satisfied by any process having $P$ as subprocess. The intuition is that the agent related with $P$ is an observer inside our system that can see only $P$. So, this epistemic agent cannot differentiate between the global states $P, P \mid Q$ or $P \mid R$ of the whole system, as in all these states it sees only $P$. Thus its knowledge rests on properties $\phi$ that are satisfied by each of these states (processes). For avoiding unnecessary syntactic sugar we name the epistemic agents by the processes they are related with.

We prove, for Dynamic Epistemic Spatial Logic, the finite model property with respect to the chosen semantics. Thus, we have decidability for satisfiability, validity and model-checking problems.

In proving the finite model property we used a new congruence on processes - the structural bisimulation. A conceptually similar congruence has been proposed in [9], but for static processes only. The structural bisimulation is interesting in itself, as it provides a bisimulation-like description of the structural congruence. Informally, it is an approximation of the structural congruence bound by two dimensions: the height and the weight of a process. The bigger these sizes, the better approximation we obtain. At the limit we find exactly the structural congruence.

For the logic we propose a complete Hilbert-style axiomatic system, which helps in understanding the basic algebraical behavior of the classical process operators. We prove its soundness and completeness with respect to the piece of CCS for which the classic spatial logic has been proved to be undecidable in [8]. Thus, many properties can be syntactically verified and proved. Moreover the interplay of our logical operators allows expression, inside the syntax, of validity and satisfiability for formulas. We also have characteristic formulas able to identify a process (agent) up to structural congruence (cloned copies).

Concluding, the novelty of our logic with respect to the classical spatial logics is the use of the epistemic operators, as alternative to guarantee operator, for expressing global properties while ensuring decidability. The epistemic operators allow to refer directly to agents of our system by mean of their knowledge. An epistemic agent is, thus, an observer that can be placed in different places in our system and has access to partial information. By combining these partial information ("points of view" of different observers) we can specify complex properties of distributed systems.

From the epistemic logics perspective, we propose a new class of epistemic logics by imposing an algebraical structure (CCS-like) on the class of epistemic agents. In this way we may assume compositional and hierarchically organized agents. Thus $P$ and $Q$ are epistemic agents, but also $P \mid Q$ may be another agent. As they are ontologically related ( $P$ and $Q$ are ontological subsidiary of $P \mid Q$ ), our logic allows to derive relations between their knowledge and dynamics from their ontological relations. In the classical epistemic logics [19] the agents are assumed to be ontologically independent entities, while our logics accepts dependencies. Other peculiarities of our epistemic logic comes from the fact that we can activate and deactivate agents: thus in a system having the current state described by $\alpha . P$, the agent that sees $P$ is not active, but it might be activated in a future state. Our logic allows also cloned agents. Thus in a system described by $P|Q| P$ we have two clones of the agent seeing $P$. All these features are new for epistemic logics. Thus, we can model simultaneously, as agents in a system, individuals, societies of individuals, societies of societies of individuals, etc and their evolutions.

## 2 On processes

In this chapter we return to CCS and we reconsider the subcalculus for which, in [8] the classical spatial logic was proved undecidable. We will use it further as semantics for our logic. We propose some new concepts that will help the future constructs. One of the most important is a new congruence on processes - the structural bisimulation. This relation will be used, further, to prove the finite model property for our logics against the process semantics in combination with the concept of pruning processes.

The structural bisimulation is interesting in itself as it provides a bisimulation-like definition for structural congruence. Informally, it is an approximation of the structural congruence bounded by two sizes: the height (the depth of the syntactic tree) and the weight (the maximum number of bisimilar subprocesses that can be found in a node of the syntactic tree) of a process. The bigger these sizes, the better approximation we obtain. At the limit, for sizes big enough with respect to the sizes of the processes involved, we find exactly the structural congruence. A conceptually similar congruence was proposed in [9] for analyzing trees of location for the static ambient calculus.

On the two sizes defined for processes, height and weight, we will introduce an effective method to construct, given process $P$, a minimal process $Q$ that has an established size $(h, w)$ and is structurally bisimilar to $P$ on this size. Because, for a small size, the construction is supposed to prune the syntactic tree of $P$, we will call this method pruning, and we refer to $Q$ as the pruned of $P$ on the size $(h, w)$.

Eventually we will extend the notions of size, structural bisimulation and pruning from processes to classes of processes. We focus our interest on contexts, defined as being special
classes of processes that contain, in a maximal manner, processes of interest for us (that might model completely or partially our system together with all its subsystems). The contexts will be used, in the next chapters, as the sets of processes on which we will define the satisfiability relation for the logics.

We recall the definition 1.1 as defining the subcalculus of CCS on which we will focus for the rest of the paper. We will not consider additional features of CCS, such as pairs of names, etc., as we want to avoid all the syntactic sugar that is irrelevant from the point of view of the logic. We might define an involution on $\mathbb{A}$ and the silent action $\tau$, but all these can be introduced, in our logic, as derived operators.

Definition 2.1. We call a process $P$ guarded iff $P \equiv \alpha . Q$ for $\alpha \in \mathbb{A}$.
We introduce the notation $P^{k} \stackrel{\text { def }}{=} \underbrace{P|\ldots| P}_{k}$, and convey to denote $P^{0} \equiv 0$.
Assumption (Representativeness modulo structural congruence). By definition, $\equiv$ is a congruence (thence an equivalence relation) over $\mathfrak{P}$. Consequently, we convey to identify processes up to structural congruence, because the structural congruence is the ultimate level of expressivity we want for our logic. Hereafter in the paper, if it is not explicitly otherwise stated, we will speak about processes up to structural congruence.

### 2.1 Size of a process

Further we propose a definition for the size of a process, following a similar idea developed in [9] for sizes of trees. The intuition is that the process has a height given by the vertical size of its syntactic tree, and a width equal to the maximum number of bisimilar subprocesses that can be identified in a node of the syntactic tree.

Definition 2.2 (Size of a process). We define the size (height and width) of a process $P$, denoted by $\llbracket P \rrbracket$, by:

- $\llbracket 0 \rrbracket \stackrel{\text { def }}{=}(0,0)$
- $\llbracket P \rrbracket \stackrel{\text { def }}{=}(h, w)$ iff

$$
\begin{aligned}
& -P \equiv\left(\alpha_{1} \cdot Q_{1}\right)^{k_{1}}\left|\left(\alpha_{2} \cdot Q_{2}\right)^{k_{2}}\right| \ldots \mid\left(\alpha_{j} \cdot Q_{j}\right)^{k_{j}} \text { and } \llbracket Q_{i} \rrbracket=\left(h_{i}, w_{i}\right), i \in 1 . . j \\
& -h=1+\max \left(h_{1}, \ldots, h_{k}\right), w=\max \left(k_{1}, \ldots, k_{j}, w_{1}, \ldots, w_{j}\right)
\end{aligned}
$$

where we used $h$ for height and $w$ for width. We convey to write $\left(h_{1}, w_{1}\right) \leq\left(h_{2}, w_{2}\right)$ for $h_{1} \leq h_{2}$ and $w_{1} \leq w_{2}$ and $\left(h_{1}, w_{1}\right)<\left(h_{2}, w_{2}\right)$ for $h_{1}<h_{2}$ and $w_{1}<w_{2}$.

Remark 2.1. Observe that, by construction, the size of a process is unique up to structural congruence. Moreover, if $\llbracket P \rrbracket=(h, w)$ then for any subprocess $P^{\prime}$ of $P$ we have $\llbracket P^{\prime} \rrbracket \leq(h, w)$.

Example 2.1. We show further the size for some processes:

$$
\begin{array}{lll}
\llbracket 0 \rrbracket=(0,0) & \llbracket \alpha .0 \rrbracket=(1,1) & \llbracket \alpha .0 \mid \beta .0 \rrbracket=(1,1) \\
\llbracket \alpha .0 \mid \alpha .0 \rrbracket=(1,2) & \llbracket \alpha . \alpha .0 \rrbracket=\llbracket \alpha . \beta .0 \rrbracket=(2,1) & \llbracket \alpha .(\beta .0 \mid \beta .0) \rrbracket=(2,2)
\end{array}
$$

Definition 2.3 (Size of a set of processes). Let $M \subset \mathfrak{P}$. We write $\llbracket M \rrbracket=(h, w)$ iff $(h, w)=\max \{\llbracket P \rrbracket \mid P \in M\}$.
As the sets of processes may be infinite, not for all of them this definition works, in the sense that some sets may have infinite sizes ${ }^{3}$. For this reason we convey to extend the order, and when $M$ has infinite size, to still write $(h, w) \leq \llbracket M \rrbracket$ and $(h, w)<\llbracket M \rrbracket$ for any $(h, w)$.

[^2]
### 2.2 Structural bisimulation

In this section we introduce the structural bisimulation, a congruence relation on processes bounded by size. It analyzes the behavior of a process focusing on a boundary of its syntactic tree. This relation will be used in the next chapter to prove the finite model property for our logics.

The intuition behind the structural bisimulation is that $P \approx_{h}^{w} Q$ ( $P$ and $Q$ are structurally bisimilar on size $(h, w)$ ) iff when we consider for both processes their syntactic trees up to the depth $h$ only (we prune them on the height $h$ ) and we ignore the presence of more than $w$ parallel bisimilar subprocesses in any node of the syntactic trees (we prune the trees on weight $w)$, we obtain syntactic trees depicting two structurally congruent processes.

The relation between the structural bisimulation and the structural congruence is interesting. We will see that the structural bisimulation depicts, step by step, the structural congruence being, in a sense, a bisimulation-like approximation of it on a given size. We will see further how $P \approx_{h}^{w} Q$ entails that, if we choose any subprocess of $P$ with the size smaller than $(h, w)$, then there exists a subprocess of $Q$ structurally congruent with it, and vice versa. Now, if the size indexing the structural bisimulation is bigger than the size of the processes, then our relation will describe structurally congruent processes. Moreover, the structural bisimulation is preserved by transitions with the price of decreasing the size.

Definition 2.4 (Structural bisimulation). Let $P, Q$ be any processes. We define $P \approx_{h}^{w} Q$ by:

- $P \approx_{0}^{w} Q$ always
- $P \approx_{h+1}^{w} Q$ iff for any $i \in 1 . . w$ and any $\alpha \in \mathbb{A}$ we have
- if $P \equiv \alpha \cdot P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$ then $Q \equiv \alpha . Q_{1}|\ldots| \alpha . Q_{i} \mid Q^{\prime}$ with $P_{j} \approx_{h}^{w} Q_{j}$, for $j=1 . . i$
- if $Q \equiv \alpha . Q_{1}|\ldots| \alpha . Q_{i} \mid Q^{\prime}$ then $P \equiv \alpha . P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$ with $Q_{j} \approx_{h}^{w} P_{j}$, for $j=1 . . i$

Example 2.2. Consider the processes

$$
R \equiv \alpha .(\beta .0|\beta .0| \beta .0) \mid \alpha . \beta .0 \text { and } S \equiv \alpha .(\beta .0 \mid \beta .0) \mid \alpha . \beta . \alpha .0
$$

We can verify the requirements of the definition 2.4 and decide that $R \approx_{2}^{2} S$. But $R \not \chi_{3}^{2} S$ because on the depth $2 R$ has an action $\alpha$ (in figure 1 marked with a dashed arrow) while $S$ does not have it (because the height of $S$ is only 2). Also $R \not \chi_{2}^{3} S$ because $R$ contains only 2 (bisimilar) copies of $\beta .0$ while $S$ contains 3 (the extra one is marked with a dashed arrow). Hence, for any weight bigger than 2 this feature will show the two processes as different. But if

Figure 1: Syntactic trees
we remain on depth 1 we have $R \approx_{1}^{3} S$, as on this deep the two processes have the same number of bisimilar subprocesses, i.e. any of them can perform $\alpha$ in two ways giving, further, processes in the relation $\approx_{0}^{3}$. Indeed

$$
\begin{gathered}
R \equiv \alpha R^{\prime} \mid \alpha R^{\prime \prime} \text {, where } R^{\prime} \equiv \beta .0|\beta .0| \beta .0 \text { and } R^{\prime \prime} \equiv \beta .0 \\
S \equiv \alpha \cdot S^{\prime} \mid \alpha . S^{\prime \prime} \text {, where } S^{\prime} \equiv \beta .0 \mid \beta .0 \text { and } S^{\prime \prime} \equiv \beta . \alpha .0
\end{gathered}
$$

By definition, $R^{\prime} \approx_{0}^{3} S^{\prime}$ and $R^{\prime \prime} \approx_{0}^{3} S^{\prime \prime}$
We focus further on the properties of the relation $\approx_{h}^{w}$. We start by proving that structural bisimulation is a congruence relation.

Theorem 2.1 (Equivalence Relation). The relation $\approx_{h}^{w}$ on processes is an equivalence relation.

Proof. We verify the reflexivity, symmetry and transitivity directly.
Reflexivity: $P \approx_{h}^{w} P$ - we prove it by induction on $h$
the case $h=0$ : we have $P \approx_{0}^{w} P$ from the definition 2.4.
the case $h+1$ : suppose that $P \equiv \alpha . P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$ for $i \in 1 . . w$ and some $\alpha \in \mathbb{A}$. The inductive hypotheses gives $P_{j} \approx_{h}^{w} P_{j}$ for each $j=1 . . i$. Further we obtain, by the definition 2.4 , that $P \approx_{h}^{w} P$.

Symmetry: if $P \approx_{h}^{w} Q$ then $Q \approx_{h}^{w} P$
Suppose that $P \equiv \alpha . P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$ for some $i \in 1 . . w$ and $\alpha \in \mathbb{A}$ then, by the definition 2.4, exists $Q \equiv \alpha . Q_{1}|\ldots| \alpha . Q_{i} \mid Q^{\prime}$ with $P_{j} \approx_{h-1}^{w} Q_{j}$ for $j=1 . . i$ and vice versa. Similarly, if we start from $Q \equiv \beta . R_{1}|\ldots| \beta . R_{k} \mid R^{\prime}$ for $k \in 1 . . w$ and $\beta \in \mathbb{A}$ we obtain $P \equiv \beta . S_{1}|\ldots| \beta . S_{k} \mid S^{\prime}$ for some $S_{j}$, with $R_{j} \approx_{h-1}^{w} S_{j}$ for $j=1 . . k$ and vice versa. Hence $Q \approx_{h}^{w} P$.

Transitivity: if $P \approx_{h}^{w} Q$ and $Q \approx_{h}^{w} R$ then $P \approx_{h}^{w} R$ - we prove it by induction on $h$. the case $h=0$ is trivial, because by the definition 2.4, for any two processes $P, R$ we have $P \approx_{0}^{w} R$
the case $h+1$ : suppose that $P \equiv \alpha . P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$ for some $i \in 1 . . w$ and $\alpha \in \mathbb{A}$. Then from $P \approx_{h}^{w} Q$ we obtain, by the definition 2.4 , that $Q \equiv \alpha \cdot Q_{1}|\ldots| \alpha \cdot Q_{i} \mid Q^{\prime}$ with $P_{j} \approx_{h-1}^{w} Q_{j}$ for $j=1 . . i$ and vice versa. Further, because $Q \approx_{h}^{w} R$, we obtain that $R \equiv \alpha . R_{1}|\ldots| \alpha . R_{i} \mid R^{\prime}$ with $Q_{j} \approx_{h-1}^{w} R_{j}$ for $j=1 . . i$ and vice versa.

As $P_{j} \approx_{h-1}^{w} Q_{j}$ and $Q_{j} \approx_{h-1}^{w} R_{j}$ for $j=1 . . i$, we obtain, using the inductive hypothesis that $P_{j} \approx_{h-1}^{w} R_{j}$ for $j=1 . . i$.

Hence, for $P \equiv \alpha . P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$, some $i \in 1 . . w$ and $\alpha \in \mathbb{A}$ we have that $R \equiv \alpha . R_{1}|\ldots| \alpha . R_{i} \mid R^{\prime}$ with $Q_{j} \approx_{h-1}^{w} R_{j}$ for $j=1 . . i$ and vice versa. This entails $P \approx_{h}^{w} R$.

Theorem 2.2. If $P \approx_{h}^{w} Q$ and $Q \equiv R$ then $P \approx_{h}^{w} R$.
Proof. Suppose that $P \equiv \alpha . P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$ for some $i \in 1 . . w$ and $\alpha \in \mathbb{A}$. As $P \approx_{h}^{w} Q$, we obtain $Q \equiv \alpha . Q_{1}|\ldots| \alpha . Q_{i} \mid Q^{\prime}$ with $P_{j} \approx_{h-1}^{w} Q_{j}$ for $j=1 . . i$ and vice versa. But $Q \equiv R$, so $R \equiv \alpha . Q_{1}|\ldots| \alpha . Q_{i} \mid Q^{\prime}$ with $P_{j} \approx_{h-1}^{w} Q_{j}$ for $j=1 . . i$ and vice versa. Hence $P \approx_{h}^{w} R$.

Theorem 2.3 (Antimonotonicity). If $P \approx_{h}^{w} Q$ and $\left(h^{\prime}, w^{\prime}\right) \leq(h, w)$ then $P \approx_{h^{\prime}}^{w^{\prime}} Q$.
Proof. We prove it by induction on $h$.
The case $h=0$ is trivial, as $\left(h^{\prime}, w^{\prime}\right) \leq(0, w)$ gives $h^{\prime}=0$ and for any processes $P, Q$ we have $P \approx_{0}^{w} Q$.

The case $h+1$ in the context of the inductive hypothesis: Suppose that $P \approx_{h+1}^{w} Q$ and $\left(h^{\prime}, w^{\prime}\right) \leq(h+1, w)$.

If $h^{\prime}=0$ we are, again, in a trivial case as for any two processes $P, Q$ we have $P \approx_{0}^{w} Q$.
If $h^{\prime}=h^{\prime \prime}+1$ then consider any $i \in 1 . . w^{\prime}$, and any $\alpha \in \mathbb{A}$ such that $P \equiv \alpha . P_{1}|\ldots| \alpha . P_{i} \mid P^{\prime}$. Because $i \leq w^{\prime} \leq w$, and as $P \approx_{h+1}^{w} Q$, we have $Q \equiv \alpha \cdot Q_{1}|\ldots| \alpha_{i} \cdot Q_{i} \mid Q^{\prime}$ with $P_{j} \approx_{h}^{w} Q_{j}$, for $j=1 . . i$. A similar argument can de developed if we start the analysis from $Q$.
But $\left(h^{\prime \prime}, w^{\prime}\right) \leq(h, w)$, so we can use the inductive hypothesis that gives $P_{j} \approx_{h^{\prime \prime}, w^{\prime}} Q_{j}$ for $j=1 . . i$. Hence $P \approx_{h^{\prime \prime}+1}^{w^{\prime}} Q$, that is, $P \approx_{h^{\prime}}^{w^{\prime}} Q$ q.e.d.

Theorem 2.4 (Congruence). The following holds:

1. if $P \approx_{h}^{w} Q$ then $\alpha \cdot P \approx_{h+1}^{w} \alpha \cdot Q$
2. if $P \approx_{h}^{w} P^{\prime}$ and $Q \approx_{h}^{w} Q^{\prime}$ then $P\left|Q \approx_{h}^{w} P^{\prime}\right| Q^{\prime}$

Proof. 1.: Suppose that $P \approx_{h}^{w} Q$. Because $\alpha . P$ is guarded, it cannot be represented as $P \equiv$ $\alpha \cdot P^{\prime} \mid P^{\prime \prime}$ for $P^{\prime \prime} \not \equiv 0$. The same about $\alpha . Q$. But this observation, together with $P \approx_{h}^{w} Q$ gives, in the light of definition 2.4, $\alpha . P \approx_{h+1}^{w} \alpha . Q$.
2.: We prove it by induction on $h$.

If $h=0$ then the conclusion is immediate.
For $h+1$, suppose that $P \approx_{h+1}^{w} P^{\prime}$ and $Q \approx_{h+1}^{w} Q^{\prime}$; then consider any $i=1 . . w, \alpha$ and $R_{j}$ for $j=1 . . i$ such that

$$
P\left|Q \equiv \alpha \cdot R_{1}\right| \ldots\left|\alpha \cdot R_{i}\right| R_{i+1}
$$

Suppose, without loss of generality, that $R_{j}$ are ordered in such a way that there exist $k \in 1 . . i$, $P^{\prime \prime}, Q^{\prime \prime}$ such that

$$
\begin{gathered}
P \equiv \alpha \cdot R_{1}|\ldots| \alpha \cdot R_{k} \mid P^{\prime \prime} \\
Q \equiv \alpha \cdot R_{k+1}|\ldots| \alpha \cdot R_{i} \mid Q^{\prime \prime} \\
R_{i+1} \equiv P^{\prime \prime} \mid Q^{\prime \prime}
\end{gathered}
$$

Because $k \in 1 . . w$, from $P \approx_{h+1}^{w} P^{\prime}$ we have $P^{\prime} \equiv \alpha . P_{1}^{\prime}|\ldots| \alpha . P_{k}^{\prime} \mid P_{0}$ such that $R_{j} \approx_{h}^{w} P_{j}^{\prime}$ for $j=1 . . k$.
Similarly, from $Q \approx_{h+1}^{w} Q^{\prime}$ we have $Q^{\prime} \equiv \alpha \cdot Q_{k+1}^{\prime}|\ldots| \alpha \cdot Q_{i}^{\prime} \mid Q_{0}$ such that $R j \approx_{h}^{w} Q_{j}^{\prime}$ for $j=$ $(k+1) . . i$. Hence, we have

$$
P^{\prime}\left|Q^{\prime} \equiv \alpha \cdot P_{1}^{\prime}\right| \ldots\left|\alpha \cdot P_{k}^{\prime}\right| \alpha \cdot Q_{k+1}^{\prime}|\ldots| \alpha \cdot Q_{i}^{\prime}\left|P_{0}\right| Q_{0}
$$

As $R_{j} \approx_{h}^{w} P_{j}^{\prime}$ for $j=1 . . k$ and $R_{j} \approx_{h}^{w} Q_{j}^{\prime}$ for $j=(k+1) . . i$, and because a similar argument starting from $P^{\prime} \mid Q^{\prime}$ is possible, we proved that $P\left|Q \approx_{h+1}^{w} P^{\prime}\right| Q^{\prime}$.

Theorem 2.5 (Inversion). If $P^{\prime} \mid P^{\prime \prime} \approx_{h}^{w_{1}+w_{2}} Q$ then exists $Q^{\prime}, Q^{\prime \prime}$ such that $Q \equiv Q^{\prime} \mid Q^{\prime \prime}$ and $P^{\prime} \approx_{h}^{w_{1}} Q^{\prime}, P^{\prime \prime} \approx_{h}^{w_{2}} Q^{\prime \prime}$.

Proof. Let $w=w_{1}+w_{2}$. We prove the theorem by induction on $h$ :
The case $h=0$ : is trivial.
The case $h+1$ : Suppose that $P^{\prime} \mid P^{\prime \prime} \approx_{h+1}^{w} Q$.
Consider the following definition: a process $P$ is in $(h, w)$-normal form if whenever $P \equiv$ $\alpha_{1} \cdot P_{1}\left|\alpha_{2} . P_{2}\right| P_{3}$ and $P_{1} \approx_{h}^{w} P_{2}$ then $P_{1} \equiv P_{2}$. Note that $P \approx_{h+1}^{w} \alpha_{1} \cdot P_{1}\left|\alpha_{2} \cdot P_{1}\right| P_{3}$. This shows that for any $P$ and any $(h, w)$ we can find a $P_{0}$ such that $P_{0}$ is in (h,w)-normal form and $P \approx_{h+1}^{w} P_{0}$.

Now, we can suppose, without loosing generality, that ${ }^{4}$ :

[^3]\[

$$
\begin{aligned}
P^{\prime} & \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}^{\prime}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{k_{n}^{\prime}} \\
P^{\prime \prime} & \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}^{\prime \prime}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{k_{n}^{\prime \prime}} \\
Q & \equiv\left(\alpha_{1} \cdot P_{1}\right)^{l_{1}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{l_{n}}
\end{aligned}
$$
\]

For each $i \in 1$..n we split $l_{i}=l_{i}^{\prime}+l_{i}^{\prime \prime}$ in order to obtain a splitting of $Q$. We define the splitting of $l_{i}$ such that $\left(\alpha_{i} \cdot P_{i}\right)^{k_{i}^{\prime}} \approx_{h+1, w_{1}}\left(\alpha_{i} . P_{i}\right)^{l_{i}^{\prime}}$ and $\left(\alpha_{i} \cdot P_{i}\right)^{k_{i}^{\prime \prime}} \approx_{h+1, w_{2}}\left(\alpha_{i} \cdot P_{i}\right)^{l_{i}^{\prime \prime}}$. We do this as follows:

- if $k_{i}^{\prime}+k_{i}^{\prime \prime}<w_{1}+w_{2}$ then $P^{\prime} \mid P^{\prime \prime} \approx_{h+1}^{w} Q$ implies $l_{i}=k_{i}^{\prime}+k_{i}^{\prime \prime}$, so we can choose $l_{i}^{\prime}=k_{i}^{\prime}$ and $l_{i}^{\prime \prime}=k_{i}^{\prime \prime}$.
- if $k_{i}^{\prime}+k_{i}^{\prime \prime} \geq w_{1}+w_{2}$ then $P^{\prime} \mid P^{\prime \prime} \approx_{h+1}^{w} Q$ implies $l_{i} \geq w_{1}+w_{2}$. We meet the following subcases:
$-k_{i}^{\prime} \geq w_{1}$ and $k_{i}^{\prime \prime} \geq w_{2}$. We choose $l_{i}^{\prime}=w_{1}$ and $l_{i}^{\prime \prime}=l_{i}-w_{1}$ (note that as $l_{i} \geq w_{1}+w_{2}$, we have $l_{i}^{\prime \prime} \geq w_{2}$ ).
$-k_{i}^{\prime}<w_{1}$, then we must have $k_{i}^{\prime \prime} \geq w_{2}$. We choose $l_{i}^{\prime}=k_{i}^{\prime}$ and $l_{i}^{\prime \prime}=l_{i}-k_{i}^{\prime}$. So $l_{i}^{\prime \prime} \geq w_{2}$ as $l_{i} \geq w_{1}+w_{2}$ and $l_{i}^{\prime}<w_{1}$.
$-k_{i}^{\prime \prime}<w_{2}$ is similar with the previous one. We choose $l_{i}^{\prime \prime}=k_{i}^{\prime \prime}$ and $l_{i}^{\prime}=l_{i}-k_{i}^{\prime \prime}$.
Now for $Q^{\prime} \equiv\left(\alpha_{1} \cdot P_{1}\right)^{l_{1}^{\prime}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{l_{n}^{\prime}}$ and $Q^{\prime \prime} \equiv\left(\alpha_{1} \cdot P_{1}\right)^{l_{1}^{\prime \prime}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{l_{n}^{\prime \prime}}$ the theorem is verified by repeatedly using theorem 2.4.

The next theorems point out the relation between the structural bisimulation and the structural congruence. We will prove that for a well-chosen boundary, which depends on the processes involved, the structural bisimulation guarantees the structural congruence. $P \approx_{h}^{w} Q$ entails that if we choose any subprocess of $P$ having the size smaller than $(h, w)$, we will find a subprocess of $Q$ structurally congruent with it, and vice versa. Now, if the size indexing the structural bisimulation is bigger than the size of the processes, then our relation will describe structurally congruent processes. We also prove that the structural bisimulation is preserved by transitions with the price of decreasing the size.

Theorem 2.6. If $\llbracket P \rrbracket \leq(h, w)$ and $\llbracket P^{\prime} \rrbracket \leq(h, w)$ then $P \approx_{h}^{w} P^{\prime}$ iff $P \equiv P^{\prime}$.
Proof. $P \equiv P^{\prime}$ implies $P \approx_{h}^{w} P^{\prime}$, because by reflexivity $P \approx_{h}^{w} P$ and then we can apply theorem 2.2.

We prove further that $P \approx_{h}^{w} P^{\prime}$ implies $P \equiv P^{\prime}$. We'll do it by induction on $h$.
The case $h=0: \llbracket P \rrbracket \leq(0, w)$ and $\llbracket P^{\prime} \rrbracket \leq(0, w)$ means $P \equiv 0$ and $P^{\prime} \equiv 0$, hence $P \equiv P^{\prime}$.
The case $h+1$ : suppose that $\llbracket P \rrbracket \leq(h+1, w), \llbracket P^{\prime} \rrbracket \leq(h+1, w)$ and $P \approx_{h+1}^{w} P^{\prime}$. We can suppose, without loosing generality, that

$$
\begin{aligned}
& P \equiv\left(\alpha_{1} \cdot Q_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{n} \cdot Q_{n}\right)^{k_{n}} \\
& P^{\prime} \equiv\left(\alpha_{1} \cdot Q_{1}\right)^{l_{1}}|\ldots|\left(\alpha_{n} \cdot Q_{n}\right)^{l_{n}}
\end{aligned}
$$

where for $i \neq j, \alpha_{i} \cdot Q_{i} \not \equiv \alpha_{j} \cdot Q_{j}$. Obviously, as $\llbracket P \rrbracket \leq(h+1, w)$ and $\llbracket P^{\prime} \rrbracket \leq(h+1, w)$ we have $k_{i} \leq w$ and $l_{i} \leq w$.

We show that $k_{i} \leq l_{i}$. If $k_{i}=0$ then, obviously, $k_{i} \leq l_{i}$. If $k_{i} \neq 0$ then $P \equiv\left(\alpha_{i} . Q_{i}\right)^{k_{i}} \mid P_{i}$ and $P \approx_{h+1}^{w} P^{\prime}$ provides that $P^{\prime} \equiv \alpha_{i} \cdot Q_{1}^{\prime \prime}\left|\ldots \alpha_{i} \cdot Q_{k_{i}}^{\prime \prime}\right| R$ with $Q_{i} \approx_{h}^{w} Q_{j}^{\prime \prime}$ for $j=1 . . k_{i}$. By construction, $\llbracket Q_{i} \rrbracket \leq((h+1)-1, w)=(h, w)$ and $\llbracket Q_{j}^{\prime \prime} \rrbracket \leq((h+1)-1, w)=(h, w)$. So, we can apply the inductive hypothesis that provides $Q_{i} \equiv Q_{j}^{\prime \prime}$ for $j=1$..i. Hence $P^{\prime} \equiv\left(\alpha_{i} \cdot Q_{i}\right)^{k_{i}} \mid R$ that gives $k_{i} \leq l_{i}$.

With a symmetrical argument we can prove that $l_{i} \leq k_{i}$ that gives $k_{i}=l_{i}$ and, finally, $P \equiv P^{\prime}$.

Theorem 2.7. If $P \approx_{h}^{w} Q$ and $\llbracket P \rrbracket<(h, w)$ then $P \equiv Q$.
Proof. Suppose that $\llbracket P \rrbracket=\left(h^{\prime}, w^{\prime}\right)$ and $P \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{k_{n}}$ with $\alpha_{i} \cdot P_{i} \not \equiv \alpha_{j} \cdot P_{j}$ for $i \neq j$. Obviously we have $k_{i} \leq w^{\prime}<w$.

We prove the theorem by induction on $h$. The first case is $h=1$ (because $h>h^{\prime}$ ).
The case $h=1$ : we have $h^{\prime}=0$ that gives $P \equiv 0$. Further $0 \approx_{1}^{w} Q$ gives $Q \equiv 0$, because else $Q \equiv \alpha \cdot Q^{\prime} \mid Q^{\prime \prime}$ asks for $0 \equiv \alpha . P^{\prime} \mid P^{\prime \prime}$ - impossible. Hence $P \equiv Q \equiv 0$.
The case $h+1$ : as $P \equiv\left(\alpha_{i} \cdot P_{i}\right)^{k_{i}} \mid P^{+}, P \approx_{h}^{w} Q$ and $k_{i}<w$, we obtain that $Q \equiv \alpha_{i} . R_{1}|\ldots| \alpha_{i} \cdot R_{k_{i}} \mid R^{+}$ with $P_{i} \approx_{h-1}^{w} R_{j}$ for any $j=1 . . k_{i}$.
But $P_{i} \approx_{h-1}^{w} R_{j}$ allows us to use the inductive hypothesis, because $\llbracket P_{i} \rrbracket \leq\left(h^{\prime}-1, w^{\prime}\right)<$ $(h-1, w)$, that gives $P_{i} \equiv R_{j}$ for any $j=1 . . k_{i}$. Hence $Q \equiv\left(\alpha_{i} . P_{i}\right)^{k_{i}} \mid R^{+}$and this is sustained for each $i=1$..n. As $\alpha_{i} . P_{i} \not \equiv \alpha_{j} . P_{j}$ for $i \neq j$, we derive $Q \equiv\left(\alpha_{1} . P_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{n} . P_{n}\right)^{k_{n}} \mid R$.

We prove now that $R \equiv 0$. Suppose that $R \equiv\left(\alpha \cdot R^{\prime}\right) \mid R^{\prime \prime}$. Then $Q \equiv \alpha \cdot R^{\prime} \mid R^{-}$, and as $P \approx_{h}^{w} Q$, we obtain that there is an $i=1 . . n$ such that $\alpha=\alpha_{i}$ and $R^{\prime} \approx_{h-1, w} P_{i}$.
Because $\llbracket P_{i} \rrbracket \leq\left(h^{\prime}-1, w^{\prime}\right)<(h-1, w)$, we can use the inductive hypothesis and obtain $R^{\prime} \equiv P_{i}$. Therefore $R \equiv \alpha_{i} . P_{i} \mid R^{\prime \prime}$, that gives further

$$
Q \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}}\left|\ldots\left(\alpha_{i-1} \cdot P_{i-1}\right)^{k_{(i-1)}}\right|\left(\alpha_{i} \cdot P_{i}\right)^{k_{i}+1}\left|\left(\alpha_{i+1} \cdot P_{i+1}\right)^{k_{(i+1)}}\right| \ldots\left|\left(\alpha_{n} \cdot P_{n}\right)^{k_{n}}\right| R
$$

So, we can consider $Q \equiv\left(\alpha_{i} \cdot P_{i}\right)^{k_{i}+1} \mid Q^{+}$. Because $P \approx_{h}^{w} Q$ and $k_{i}+1 \leq w^{\prime}+1 \leq w$, we obtain that $P \equiv \alpha_{i} \cdot P_{1}^{\prime}|\ldots| \alpha_{i} . P_{k_{i}+1}^{\prime} \mid P^{\prime}$ with $P_{j}^{\prime} \approx_{h-1}^{w} P_{i}$ for any $j=1 . . k_{i}+1$.
But $\llbracket P_{i} \rrbracket \leq\left(h^{\prime}-1, w^{\prime}\right)<(h-1, w)$, consequently we can use the inductive hypothesis and obtain $P_{j}^{\prime} \equiv P_{i}$ for any $j=1 . . k_{i}+1$.
Hence $P \equiv\left(\alpha_{i} \cdot P_{i}\right)^{k_{i}+1} \mid P^{\prime \prime}$ which is impossible because we supposed that $P \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{k_{n}}$ with $\alpha_{i} . P_{i} \not \equiv \alpha_{j} . P_{j}$ for $i \neq j$.

Concluding, $R \equiv 0$ and $Q \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{n} . P_{n}\right)^{k_{n}}$, i.e. $Q \equiv P$.

Theorem 2.8. If $P \equiv R \mid P^{\prime}, P \approx_{h}^{w} Q$ and $\llbracket R \rrbracket<(h, w)$ then $Q \equiv R \mid Q^{\prime}$.

Proof. Suppose that $\llbracket R \rrbracket=\left(h^{\prime}, w^{\prime}\right)<(h, w)$. Because $P \equiv R \mid P^{\prime}$ and $P \approx_{h}^{w} Q$, using theorem 2.5, we obtain that exists $Q_{1}, Q_{2}$ such that $Q \equiv Q_{1} \mid Q_{2}$ and $R \approx_{h}^{w^{\prime}+1} Q_{1}$ and $P^{\prime} \approx_{h}^{w-\left(w^{\prime}+1\right)} Q_{2}$. Further, as $R \approx_{h}^{w^{\prime}+1} Q_{1}$ and $\llbracket R \rrbracket=\left(h^{\prime}, w^{\prime}\right)<\left(h, w^{\prime}+1\right)$ we obtain, by using theorem 2.7, that $Q_{1} \equiv R$, hence $Q \equiv R \mid Q_{2}$.

Theorem 2.9. Let $P \approx_{h}^{w} Q$. If $P \equiv \alpha \cdot P^{\prime} \mid P^{\prime \prime}$ then $Q \equiv \alpha \cdot Q^{\prime} \mid Q^{\prime \prime}$ and $P^{\prime}\left|P^{\prime \prime} \approx_{h-1}^{w-1} Q^{\prime}\right| Q^{\prime \prime}$
Proof. As $P \approx_{h}^{w} Q$ and $P \equiv \alpha . P^{\prime} \mid P^{\prime \prime}$, we obtain that, indeed, $Q \equiv \alpha \cdot Q^{\prime} \mid Q^{\prime \prime}$ with $P^{\prime} \approx_{h-1}^{w} Q^{\prime}$. We will prove that $P^{\prime}\left|P^{\prime \prime} \approx_{h-1}^{w-1} Q^{\prime}\right| Q^{\prime \prime}$. Consider any $i=1 . . w-1$ and $\beta \in \mathbb{A}$ such that:

$$
\begin{equation*}
P^{\prime}\left|P^{\prime \prime} \equiv \beta . P_{1}\right| \ldots\left|\beta . P_{i}\right| P^{\star} \tag{2.1}
\end{equation*}
$$

We can suppose, without loos of generality that for some $k \leq i$ we have

$$
\begin{gathered}
P^{\prime} \equiv \beta \cdot P_{1}|\ldots| \beta \cdot P_{k} \mid P^{+} \\
P^{\prime \prime} \equiv \beta \cdot P_{k+1}|\ldots| \beta . P_{i} \mid P^{-} \\
P^{\star} \equiv P^{+} \mid P^{-}
\end{gathered}
$$

Because $P^{\prime} \approx_{h-1}^{w} Q^{\prime}$ and $k \leq i \leq w-1$, we obtain that $Q^{\prime} \equiv \beta \cdot Q_{1}|\ldots| \beta \cdot Q_{k} \mid Q^{+}$with $P_{j} \approx_{h-2}^{w} Q_{j}$ for $j=1 . . k$. Further we distinguish two cases:

- if $\alpha \neq \beta$ then we have

$$
P \equiv \beta \cdot P_{k+1}|\ldots| \beta \cdot P_{i} \mid\left(P^{-} \mid \alpha \cdot P^{\prime}\right)
$$

and because $P \approx_{h}^{w} Q$, we obtain

$$
Q \equiv \beta \cdot R_{k+1}|\ldots| \beta . R_{i} \mid R^{\star} \text { with } R_{j} \approx_{h-1}^{w} P_{j} \text { for } j=k+1 . . i
$$

But $Q \equiv \alpha \cdot Q^{\prime} \mid Q^{\prime \prime}$ and because $\alpha \neq \beta$, we obtain $Q^{\prime \prime} \equiv \beta \cdot R_{k+1}|\ldots| \beta \cdot R_{i} \mid R^{+}$that gives us in the end

$$
Q^{\prime}\left|Q^{\prime \prime} \equiv \beta \cdot Q_{1}\right| \ldots\left|\beta \cdot Q_{k}\right| \beta \cdot R_{k+1}|\ldots| \beta \cdot R_{i} \mid\left(R^{+} \mid Q^{+}\right)
$$

with $P_{j} \approx_{h-2}^{w} Q_{j}$ for $j=1 . . k$ (hence $P_{j} \approx_{h-2}^{w-1} Q_{j}$ ) and $P_{j} \approx_{h-1}^{w} R_{j}$ for $j=k+1 . . i$ (hence $\left.P_{j} \approx_{h-2}^{w-1} R_{j}\right)$.

- if $\alpha=\beta$ then we have

$$
P \equiv \alpha \cdot P_{k+1}|\ldots| \alpha \cdot P_{i}\left|\alpha . P^{\prime}\right| P^{-}
$$

and as $P \approx_{h}^{w} Q$ and $i \leq w-1$, we obtain

$$
Q \equiv \alpha \cdot R_{k+1}|\ldots| \alpha \cdot R_{i}\left|\alpha \cdot R^{\prime}\right| R^{\star}
$$

with $R_{j} \approx_{h-1}^{w} P_{j}$ for $j=k+1 . . i$ and $R^{\prime} \approx_{h-1}^{w} P^{\prime}$. Because $P^{\prime} \approx_{h-1}^{w} Q^{\prime}$ and $\approx_{h}^{w}$ is an equivalence relation, we can suppose that $R^{\prime} \equiv Q^{\prime}$ (Indeed, if $\alpha \cdot Q^{\prime}$ is a subprocess of $R^{\star}$ then we can just substitute $R^{\prime}$ with $Q^{\prime}$; if $\alpha \cdot Q^{\prime} \equiv \alpha . R_{s}$, then $Q^{\prime} \approx_{h-1}^{w} P_{s}$ and as $Q^{\prime} \approx_{h-1}^{w} P^{\prime}$ and $P^{\prime} \approx_{h-1}^{w} R^{\prime}$ we derive $R^{\prime} \approx_{h-1}^{w} P_{s}$ and $Q^{\prime} \approx_{h-1}^{w} P^{\prime}$, so we can consider this correspondence). So

$$
Q \equiv \alpha \cdot R_{k+1}|\ldots| \alpha \cdot R_{i}\left|\alpha \cdot Q^{\prime}\right| R^{\star}
$$

that gives

$$
Q^{\prime \prime} \equiv \alpha \cdot R_{k+1}|\ldots| \alpha . R_{i} \mid R^{\star}
$$

which entails further

$$
Q^{\prime}\left|Q^{\prime \prime} \equiv \alpha \cdot Q_{1}\right| \ldots\left|\alpha \cdot Q_{k}\right| \alpha \cdot R_{k+1}|\ldots| \alpha \cdot R_{i} \mid\left(R^{\star} \mid Q^{+}\right)
$$

with $P_{j} \approx_{h-2}^{w} Q_{j}$ for $j=1 . . k$ (hence $P_{j} \approx_{h-2}^{w-1} Q_{j}$ ) and $P_{j} \approx_{h-1}^{w} R_{j}$ for $j=k+1 . . i$ (hence $\left.P_{j} \approx_{h-2}^{w-1} R_{j}\right)$.

All these prove that $P^{\prime}\left|P^{\prime \prime} \approx_{h-1}^{w-1} Q^{\prime}\right| Q^{\prime \prime}$ (as we can develop a symmetric argument starting in (2.1) with $\left.Q \mid Q^{\prime}\right)$.

Theorem 2.10 (Behavioral simulation). Let $P \approx_{h}^{w} Q$. If $P \xrightarrow{\alpha} P^{\prime}$ then exists a transition $Q \xrightarrow{\alpha} Q^{\prime}$ such that $P^{\prime} \approx_{h-1}^{w-1} Q^{\prime}$.

Proof. If $P \xrightarrow{\alpha} P^{\prime}$ then $P \equiv \alpha \cdot R^{\prime} \mid R^{\prime \prime}$ and $P^{\prime} \equiv R^{\prime} \mid R^{\prime \prime}$. But $P \approx_{h}^{w} Q$ gives, using theorem 2.9 that $Q \equiv \alpha \cdot S^{\prime} \mid S^{\prime \prime}$ and $R^{\prime}\left|R^{\prime \prime} \approx_{h-1}^{w-1} S^{\prime}\right| S^{\prime \prime}$. And because $Q \xrightarrow{\alpha} S^{\prime} \mid S^{\prime \prime}$, we can take $Q^{\prime} \equiv$ $S^{\prime} \mid S^{\prime \prime}$.

### 2.3 Bound pruning processes

In this subsection we prove the bound pruning theorem, stating that for a given process $P$ and a given size $(h, w)$, we can always find a process $Q$ having the size at most equal with $(h, w)$ such that $P \approx_{h}^{w} Q$. Moreover, in the proof of the theorem we will present a method for constructing such a process from $P$, by pruning its syntactic tree to the given size.

Theorem 2.11 (Bound pruning theorem). For any process $P \in \mathfrak{P}$ and any $(h, w)$ exists a process $Q \in \mathfrak{P}$ with $P \approx_{h}^{w} Q$ and $\llbracket Q \rrbracket \leq(h, w)$.

Proof. We describe the construction ${ }^{5}$ of $Q$ by induction on $h$.
For $h=0$ : we just take $Q \equiv 0$, because $P \approx_{0}^{w} Q$ and $\llbracket 0 \rrbracket=(0,0)$.
For $h+1$ : suppose that $P \equiv \alpha_{1} \cdot P_{1}|\ldots| \alpha_{n} . P_{n}$.
Let $P_{i}^{\prime}$ be the result of pruning $P_{i}$ by $(h, w)$ (we use the inductive step of construction) and $P^{\prime} \equiv \alpha_{1} \cdot P_{1}^{\prime}|\ldots| \alpha_{n} . P_{n}^{\prime}$. As for any $i=1 . . n$ we have $P_{i} \approx_{h}^{w} P_{i}^{\prime}$ (by the inductive hypothesis), we obtain, using theorem 2.4, that $\alpha_{i} . P_{i} \approx_{h+1}^{w} \alpha_{i} . P_{i}^{\prime}$ and further $P \approx_{h+1}^{w} P^{\prime}$.
Consider the canonical representation of $P^{\prime} \equiv\left(\beta_{1} \cdot Q_{1}\right)^{k_{1}}|\ldots|\left(\beta_{m} . Q_{m}\right)^{k_{m}}$.
Let $l_{i}=\min \left(k_{i}, w\right)$ for $i=1 . . m$. Then we define $Q \equiv\left(\beta_{1} \cdot Q_{1}\right)^{l_{1}}|\ldots|\left(\beta_{m} \cdot Q_{m}\right)^{l_{m}}$. Obviously $Q \approx_{h+1}^{w} P^{\prime}$ and as $P \approx_{h+1}^{w} P^{\prime}$, we obtain $P \approx_{h+1}^{w} Q$. By construction, $\llbracket Q \rrbracket \leq(h+1, w)$.

Definition 2.5 (Bound pruning processes). For a process $P$ and for a tuple (h,w) we denote by $P_{(h, w)}$ the process obtained by pruning $P$ to the size $(h, w)$ by the method described in the proof of theorem 2.11.

Example 2.3. Consider the process $P \equiv \alpha .(\beta .(\gamma .0|\gamma .0| \gamma .0) \mid \beta . \gamma .0) \mid \alpha . \beta . \gamma .0$.
Observe that $\llbracket P \rrbracket=(3,3)$, hence $P_{(3,3)} \equiv P$. For constructing $P_{(3,2)}$ we have to prune the syntactic tree of $P$ such that to not exist, in any node, more than two bisimilar branches. Hence $P_{(3,2)}=\alpha .(\beta .(\gamma .0 \mid \gamma .0) \mid \beta . \gamma .0) \mid \alpha . \beta . \gamma .0$
If we want to prune $P$ on the size $(3,1)$, we have to prune its syntactic tree such that, in any node, there are no bisimilar branches. The result is $P_{(3,1)}=\alpha . \beta . \gamma .0$.
For pruning $P$ on the size $(2,2)$, we have to prune all the nodes on depth 2 and in the new tree we have to let, in any node, a maximum of two bisimilar branches. As a result of these modifications, we obtain $P_{(2,2)}=\alpha .(\beta .0 \mid \beta .0) \mid \alpha . \beta .0$. Going further we obtain the smaller processes $P_{(0,0)}=0, P_{(1,1)}=\alpha .0, P_{(1,2)}=\alpha .0 \mid \alpha .0, P_{(2,1)}=\alpha . \beta .0$.

Corollary 2.12. If $P \equiv Q$ then $P_{(h, w)} \equiv Q_{(h, w)}$.
Proof. Because a process is unique up to structural congruence, the result can be derived trivially, following the construction in the proof of theorem 2.11.

Corollary 2.13. $\llbracket P \rrbracket \leq(h, w)$ iff $P_{(h, w)} \equiv P$.
Proof. $(\Rightarrow)$ If $\llbracket P \rrbracket \leq(h, w)$, then, by construction, $\llbracket P_{(h, w)} \rrbracket \leq(h, w)$ and $P \approx_{h}^{w} P_{(h, w)}$, we can use theorem 2.6 and obtain $P_{(h, w)} \equiv P$.
$(\Leftarrow)$ Suppose that $P_{(h, w)} \equiv P$. Suppose, in addition that $\llbracket P \rrbracket>(h, w)$. By construction, $\llbracket P_{(h, w)} \rrbracket \leq(h, w)$, hence $\llbracket P_{(h, w)} \rrbracket \leq(h, w)<\llbracket P \rrbracket$, i.e. $\llbracket P_{(h, w)} \rrbracket \neq \llbracket P \rrbracket$. But this is impossible, because the size of a process is unique up to structural congruence, see remark 2.1.

### 2.4 Substitutions

For the future constructs is also useful to introduce the substitutions of actions in a process.

[^4]Definition 2.6 (The set of actions of a process). We define $\operatorname{Act}(P) \subset \mathbb{A}$, inductively by:

1. $\operatorname{Act}(0) \stackrel{\text { def }}{=} \emptyset$
2. $\operatorname{Act}(\alpha . P) \stackrel{\text { def }}{=}\{\alpha\} \cup \operatorname{Act}(P)$
3. $\operatorname{Act}(P \mid Q) \stackrel{\text { def }}{=} \operatorname{Act}(P) \cup \operatorname{Act}(Q)$

For a set $M \subset \mathfrak{P}$ of processes we define $\operatorname{Act}(M) \stackrel{\text { def }}{=} \bigcup_{P \in M} \operatorname{Act}(P)$.
We will define further the set of all processes having a size smaller than a given tuple $(h, w)$ and the actions in a set $A \subset \mathbb{A}$, and we will prove that for the fragment of CCS we considered they are finitely many (modulo $\equiv$ ).

Definition 2.7. Let $A \subset \mathbb{A}$. We define

$$
\mathfrak{P}_{(h, w)}^{A} \stackrel{\text { def }}{=}\{P \in \mathfrak{P} \mid \operatorname{Act}(P) \subset A, \llbracket P \rrbracket \leq(h, w)\}
$$

Theorem 2.14. If $A \subset \mathbb{A}$ is finite, then $\mathfrak{P}_{(h, w)}^{A}$ is finite ${ }^{6}$.
Proof. We will prove more, that if we denote by $n=(w+1)^{\operatorname{card}(A)}$, then

$$
\operatorname{card}\left(\mathfrak{P}_{(h, w)}^{A}\right)= \begin{cases}1 & \text { if } h=0 \\ \underbrace{n^{n^{n} \cdots^{n}}}_{h} & \text { if } h \neq 0\end{cases}
$$

We prove this by induction on $h$.
The case $h=0$ : we have $\llbracket Q \rrbracket=(0, w)$ iff $Q \equiv 0$, so $\mathfrak{P}_{(0, w)}^{A}=\{0\}$ and $\operatorname{card}\left(\mathfrak{P}_{(0, w)}^{A}\right)=1$.
The case $h=1$ : let $Q \in \mathfrak{P}_{(1, w)}$. Then

$$
Q \equiv\left(\alpha_{1} \cdot Q_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{s} \cdot Q_{s}\right)^{k_{s}} \text { with } Q_{i} \in \mathfrak{P}_{(0, w)}^{A} \text { and } \alpha_{i} \cdot Q_{i} \not \equiv \alpha_{j} \cdot Q_{j} \text { for } i \neq j
$$

But $Q_{i} \in \mathfrak{P}_{(0, w)}^{A}$ means $Q_{i} \equiv 0$, hence

$$
Q \equiv\left(\alpha_{1} .0\right)^{k_{1}}|\ldots|\left(\alpha_{s} .0\right)^{k_{s}}
$$

Since $\llbracket Q \rrbracket \leq(1, w)$ we obtain that $k_{i} \leq w$. The number of guarded processes $\alpha .0$ with $\alpha \in A$ is $\operatorname{card}(A)$ and since $k_{i} \in 0 . . w$, the number of processes in $\mathfrak{P}_{(1, w)}^{A}$ is $(w+1)^{\operatorname{card}(A)}=n^{1}$.

The case $h+1$ : let $Q \in \mathfrak{P}_{(h+1, w)}^{A}$. Then

$$
Q \equiv\left(\alpha_{1} \cdot Q_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{s} \cdot Q_{s}\right)^{k_{s}} \text { with } Q_{i} \in \mathfrak{P}_{(h, w)}^{A} \text { and } \alpha_{i} \cdot Q_{i} \not \equiv \alpha_{j} \cdot Q_{j} \text { for } i \neq j
$$

Since $\llbracket Q \rrbracket \leq(h+1, w)$ we obtain that $k_{i} \leq w$. The number of guarded processes $\alpha . R$ with $\alpha \in A$ and $R \in \mathfrak{P}_{(h, w)}^{A}$ is $\operatorname{card}(A) \times \operatorname{card}\left(\mathfrak{P}_{(h, w)}^{A}\right)$ and since $k_{i} \in 0 . . w$, the number of processes in $\mathfrak{P}_{(h+1, w)}^{A}$ is $(w+1)^{\operatorname{card}(A) \times \operatorname{card}\left(\mathfrak{P}_{(h, w)}^{A}\right)}=\left((w+1)^{\operatorname{card}(A)}\right)^{\operatorname{card}\left(\mathfrak{P}_{(h, w)}^{A}\right)}=n^{\operatorname{card}\left(\mathfrak{P}_{(h, w)}^{A}\right)}$. But the inductive hypothesis gives $\operatorname{card}\left(\mathfrak{P}_{(h, w)}^{A}\right)=\underbrace{n^{n^{n^{n}}}}_{h}$, so $\operatorname{card}\left(\mathfrak{P}_{(h+1, w)}^{A}\right)=\underbrace{n^{n^{n} \cdots^{n}}}_{h+1}$.

Definition 2.8 (Action substitution). We call action substitution any function $\sigma: \mathbb{A} \longrightarrow \mathbb{A}$. We extend it further, syntactically, from actions to processes, $\sigma: \mathfrak{P} \longrightarrow \mathfrak{P}$, by

$$
\sigma(P)= \begin{cases}0 & \text { if } P \equiv 0 \\ \sigma(Q) \mid \sigma(R) & \text { if } P \equiv Q \mid R \\ \sigma(\gamma) \cdot \sigma(R) & \text { if } P \equiv \gamma \cdot R\end{cases}
$$

We extend $\sigma$ for sets of processes $M \subset \mathfrak{P}$ by $\sigma(M) \stackrel{\text { def }}{=}\{\sigma(P) \mid P \in M\}$.
For short, we will denote, sometimes, $\sigma(P)$ by $P^{\sigma}$ and $\sigma(M)$ by $M^{\sigma}$.
Remark 2.2. Observe that $P \equiv Q$ entails $\operatorname{Act}(P)=\operatorname{Act}(Q)$ and $P^{\sigma} \equiv Q^{\sigma}$.

[^5]Definition 2.9. Let $\sigma$ be a substitution. We define the subject of $\sigma, \operatorname{sub}(\sigma)$ and the object of $\sigma, \operatorname{obj}(\sigma)$, by:

$$
\begin{gathered}
\operatorname{sub}(\sigma) \stackrel{\text { def }}{=}\{\alpha \in \mathbb{A} \mid \sigma(\alpha) \neq \alpha\} \\
\operatorname{obj}(\sigma) \stackrel{\text { def }}{=}\{\beta \in \mathbb{A} \mid \beta \neq \alpha, \sigma(\alpha)=\beta\}
\end{gathered}
$$

Theorem 2.15. If $\operatorname{sub}(\sigma) \cap \operatorname{Act}(P)=\emptyset$ then $\sigma(P) \equiv P$.
Proof. We prove it by induction on $P$.
The case $P \equiv 0$ : by definition, $\sigma(0) \equiv 0$.
The case $P \equiv \alpha \cdot Q: \sigma(P) \equiv \sigma(\alpha) \cdot \sigma(Q)$. But $\alpha \in \operatorname{Act}(P)$, and because $\operatorname{Act}(P) \cap \operatorname{sub}(\sigma)=\emptyset$, we obtain $\alpha \notin \operatorname{sub}(\sigma)$, hence $\sigma(\alpha)=\alpha$. But then $\sigma(P) \equiv \alpha \cdot \sigma(Q)$. Further $\operatorname{Act}(Q) \subset \operatorname{Act}(P)$, i.e. $\operatorname{Act}(Q) \cap \operatorname{sub}(\sigma)=\emptyset$ and we can apply the inductive hypothesis that provides $\sigma(Q) \equiv Q$, so $\sigma(P) \equiv \alpha$. $Q$, q.e.d.
The case $P \equiv Q|R: \sigma(P) \equiv \sigma(Q)| \sigma(R)$. But $\operatorname{Act}(Q), \operatorname{Act}(R) \subset \operatorname{Act}(P)$, hence $\operatorname{Act}(Q) \cap$ $\operatorname{sub}(\sigma)=\operatorname{Act}(R) \cap \operatorname{sub}(\sigma)=\emptyset$. Hence we can apply the inductive hypothesis that provides $\sigma(Q) \equiv Q$ and $\sigma(R) \equiv R$, thus $\sigma(P) \equiv Q \mid R \equiv P$.

Theorem 2.16. If $\operatorname{obj}(\sigma) \cap \operatorname{Act}(P)=\emptyset$ then $\sigma(Q) \equiv P$ implies $Q \equiv P$.
Proof. We prove it by induction on $P$.
If $P \equiv 0$ : if $Q \not \equiv 0$ then $Q \equiv \alpha \cdot Q^{\prime} \mid Q^{\prime \prime}$, thus $\sigma(Q) \equiv \sigma(\alpha) \cdot \sigma\left(Q^{\prime}\right) \mid \sigma\left(Q^{\prime \prime}\right) \not \equiv 0$. Impossible.
If $P \not \equiv 0$ : Suppose that

$$
P \equiv \alpha_{1} \cdot P_{1}|\ldots| \alpha_{n} \cdot P_{n}
$$

and

$$
Q \equiv \beta_{1} \cdot Q_{1}|\ldots| \beta_{m} \cdot Q_{m}
$$

Then $\sigma(Q) \equiv \sigma\left(\beta_{1}\right) \cdot \sigma\left(Q_{1}\right)|\ldots| \sigma\left(\beta_{m}\right) \cdot \sigma\left(Q_{m}\right)$ and

$$
\alpha_{1} \cdot P_{1}|\ldots| \alpha_{n} \cdot P_{n} \equiv \sigma\left(\beta_{1}\right) \cdot \sigma\left(Q_{1}\right)|\ldots| \sigma\left(\beta_{m}\right) \cdot \sigma\left(Q_{m}\right)
$$

But then $m=n$ and for each $i=1$..n there exists $j=1 . . n$ such that $\alpha_{i} . P_{i} \equiv \sigma\left(\beta_{j}\right) . \sigma\left(Q_{j}\right)$, thus $\alpha_{i}=\sigma\left(\beta_{j}\right)$. But from $\operatorname{obj}(\sigma) \cap \operatorname{Act}(P)=\emptyset$ we derive $\sigma\left(\beta_{j}\right)=\beta_{j}=\alpha_{i}$. Further, from $\alpha_{i} . P_{i} \equiv \sigma\left(\beta_{j}\right) \cdot \sigma\left(Q_{j}\right)$ we infer $P_{i} \equiv \sigma\left(Q_{j}\right)$, and since $\operatorname{Act}\left(P_{i}\right) \subset \operatorname{Act}(P)$, we can use the inductive hypothesis and derive $P_{i} \equiv Q_{j}$. Thus $P \equiv Q$.

Theorem 2.17. If $\sigma(P) \equiv Q \mid R$ then there exist processes $Q^{\prime}, R^{\prime}$ such that $P \equiv Q^{\prime} \mid R^{\prime}$, with $\sigma\left(Q^{\prime}\right) \equiv Q$ and $\sigma\left(R^{\prime}\right) \equiv R$.

Proof. Suppose that $P \equiv \alpha_{1} \cdot P_{1}|\ldots| \alpha_{n} . P_{n}$. Then

$$
\sigma(P) \equiv \sigma\left(\alpha_{1}\right) \cdot \sigma\left(P_{1}\right)|\ldots| \sigma\left(\alpha_{n}\right) \cdot \sigma\left(P_{n}\right) \equiv Q \mid R
$$

We can suppose, without loosing generality, that

$$
\begin{gathered}
Q \equiv \sigma\left(\alpha_{1}\right) \cdot \sigma\left(P_{1}\right)|\ldots| \sigma\left(\alpha_{i}\right) \cdot \sigma\left(P_{i}\right) \\
R \equiv \sigma\left(\alpha_{i+1}\right) \cdot \sigma\left(P_{i+1}\right)|\ldots| \sigma\left(\alpha_{n}\right) \cdot \sigma\left(P_{n}\right)
\end{gathered}
$$

Then we can define $Q^{\prime} \equiv \alpha_{1} \cdot P_{1}|\ldots| \alpha_{i} . P_{i}$ and $R^{\prime} \equiv \alpha_{i+1} \cdot P_{i+1}|\ldots| \alpha_{n} . P_{n}$.

Theorem 2.18. If $P \not \equiv R \mid Q$ and $\operatorname{obj}(\sigma) \cap \operatorname{Act}(R)=\emptyset$, then $\sigma(P) \not \equiv R \mid S$.
Proof. Suppose that $\sigma(P) \equiv R \mid S$ for some $S$. Then, by the theorem 2.17, there exists $R^{\prime}, S^{\prime}$ such that $P \equiv S^{\prime} \mid R^{\prime}$ and $\sigma\left(R^{\prime}\right) \equiv R, \sigma\left(S^{\prime}\right) \equiv S$. But because $\operatorname{obj}(\sigma) \cap \operatorname{Act}(R)=\emptyset$ and $\sigma\left(R^{\prime}\right) \equiv R$, we derive, applying the theorem 2.16 , that $R^{\prime} \equiv R$, hence $P \equiv R \mid S^{\prime}$. But this contradicts the hypothesis of the theorem. So, there is no $S$ such that $\sigma(P) \equiv R \mid S$.

## 3 Contexts

In this section we introduce the contexts, sets of processes that will be used to evaluate formulas of our logics. The intuition is that a context $\mathcal{M}$ is a (possibly infinite) set of processes that contains, in a maximal manner, any process representing a possible state of our system or of a subsystem of our system. Hence if a process belongs to a context then any process obtained by pruning its syntactic tree, in any way ${ }^{7}$, should belong to the context, as it might represent a subsystem. For the same reason, the context should be also closed to transitions.

It is useful in this point to define some operations on sets of processes.
Definition 3.1. For any sets of processes $M, N \subset \mathfrak{P}$ and any $\alpha \in \mathbb{A}$ we define:

$$
\alpha . M \stackrel{\text { def }}{=}\{\alpha . P \mid P \in M\} \quad M \mid N \stackrel{\text { def }}{=}\{P|Q| P \in M, Q \in N\}
$$

As we speak about processes up to structural congruence, the parallel operator on sets of processes will be commutative, associative and will have $\{0\}$ as null.

We associate further to each process $P$ the set $\pi(P)$ of all processes obtained by pruning, in the most general way, the syntactic tree of $P$.

Definition 3.2. For $P \in \mathfrak{P}$ we define ${ }^{8} \pi(P) \subset \mathfrak{P}$ inductively by:

1. $\pi(0) \stackrel{\text { def }}{=}\{0\}$
2. $\pi(\alpha . P) \stackrel{\text { def }}{=}\{0\} \cup \alpha . \pi(P)$
3. $\pi(P \mid Q) \stackrel{\text { def }}{=} \pi(P) \mid \pi(Q)$

We extend the definition of $\pi$ to sets of processes $M \subset \mathfrak{P}$ by $\pi(M) \stackrel{\text { def }}{=} \bigcup_{P \in M} \pi(P)$.
Theorem 3.1. The next assertions hold:

1. $P \in \pi(P)$
2. $0 \in \pi(P)$
3. $P \in \pi(P \mid Q)$
4. $P_{(h, w)} \in \pi(P)$

Proof. 1. We prove it by induction on $P$

- if $P \equiv 0$ then $\pi(P)=\{0\} \ni 0 \equiv P$
- if $P \equiv \alpha . Q$ then $\pi(P)=\{0\} \cup \alpha . \pi(Q)$. But the inductive hypothesis gives $Q \in \pi(Q)$, hence $\alpha . Q \in \alpha . \pi(Q) \subset \pi(P)$.
- if $P \equiv Q \mid R$ then $\pi(P)=\pi(Q) \mid \pi(R)$. The inductive hypothesis provide $Q \in \pi(Q)$ and $R \in \pi(R)$, hence $P \equiv Q|R \in \pi(Q)| \pi(R)=\pi(P)$.

2. We prove it by induction on $P$.

- if $P \equiv 0$ we have, by definition, $\pi(P)=\{0\} \ni 0$
- if $P \equiv \alpha . Q$ then $\pi(P)=\{0\} \cup \alpha . \pi(Q) \ni 0$.
- if $P \equiv Q \mid R$ then $\pi(P)=\pi(Q) \mid \pi(R)$. The inductive hypothesis provide $0 \in \pi(Q)$ and $0 \in \pi(R)$, hence $0 \equiv 0|0 \in \pi(Q)| \pi(R)=\pi(P)$.

[^6]3. We have $\pi(P \mid Q)=\pi(P) \mid \pi(Q)$. But $P \in \pi(P)$ and $0 \in \pi(Q)$, hence $P \equiv P|0 \in \pi(P)| \pi(Q)=$ $\pi(P \mid Q)$.
4. We prove the theorem by induction on the structure of $P$.

- if $P \equiv 0$ : we have $P_{(h, w)} \equiv 0 \in\{0\}=\pi(P)$ for any $(h, w)$.
- if $P \equiv \alpha . Q:$ we distinguish two more cases:
if $w=0$ then $P_{(h, 0)} \equiv 0 \in \pi(P)$
if $w \neq 0$ then $(\alpha \cdot Q)_{(h, w)} \equiv \alpha \cdot Q_{(h-1, w)}$ by the construction of the adjusted processes. If we apply the inductive hypothesis we obtain that $Q_{(h-1, w)} \in \pi(Q)$, hence $(\alpha \cdot Q)_{(h, w)} \in$ $\alpha . \pi(Q) \subset \pi(P)$.
- if $P \equiv(\alpha \cdot Q)^{k}$ : we have $P_{(h, w)} \equiv\left(\alpha \cdot Q_{(h-1, w)}\right)^{l}$ where $l=\min (k, w)$, by the construction of the adjusted processes. The inductive hypothesis gives $Q_{(h-1, w)} \in \pi(Q)$, hence $\alpha . Q_{(h-1, w)} \in \alpha \cdot \pi(Q) \subset \pi(\alpha . Q)$. But because $0 \in \pi(\alpha . Q)$ and

$$
P_{(h, w)} \equiv \underbrace{\alpha \cdot Q_{(h-1, w)}|\ldots| \alpha \cdot Q_{(h-1, w)}}_{l} \mid \underbrace{0|\ldots| 0}_{k-l}
$$

we obtain

$$
P_{(h, w)} \in \underbrace{\pi(\alpha \cdot Q)|\ldots| \pi(\alpha \cdot Q)}_{k}=\pi(P)
$$

- if $P \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{n} \cdot P_{n}\right)^{k_{n}}$ with $n \geq 2:$ we split it in two subprocesses $Q \equiv\left(\alpha_{1} \cdot P_{1}\right)^{k_{1}}|\ldots|\left(\alpha_{i} \cdot P_{i}\right)^{k_{i}}$ and $R \equiv\left(\alpha_{i+1} \cdot P_{i+1}\right)^{k_{i+1}}|\ldots|\left(\alpha_{n} . P_{n}\right)^{k_{n}}$. By the way we split the process $P$ we will have $P_{(h, w)} \equiv Q_{(h, w)} \mid R_{(h, w)}$ and using the inductive hypothesis on $Q$ and $R$ we derive $P_{(h, w)} \equiv Q_{(h, w)}\left|R_{(h, w)} \in \pi(Q)\right| \pi(R)=\pi(P)$.

Theorem 3.2. 1. $\operatorname{Act}(\pi(P)) \subseteq \operatorname{Act}(P) \quad$ 2. If $P \longrightarrow Q$ then $\operatorname{Act}(Q) \subseteq \operatorname{Act}(P)$.
Proof. 1. We prove it by induction on $P$.
if $P \equiv 0$ then $\operatorname{Act}(\pi(P))=\operatorname{Act}(\emptyset)=\emptyset \subseteq \operatorname{Act}(P)$.
if $P \equiv \alpha \cdot Q$ then $\operatorname{Act}(\pi(P))=\operatorname{Act}(\{0\} \cup \alpha \cdot \pi(Q))=\operatorname{Act}(\alpha \cdot \pi(Q))=\{\alpha\} \cup \operatorname{Act}(\pi(Q))$. By inductive hypothesis, $\operatorname{Act}(\pi(Q)) \subseteq \operatorname{Act}(Q)$, hence $\operatorname{Act}(\pi(P)) \subseteq\{\alpha\} \cup \operatorname{Act}(Q)=\operatorname{Act}(P)$.
if $P \equiv Q \mid R$ then $\operatorname{Act}(\pi(P))=\operatorname{Act}(\pi(Q) \mid \pi(R))=\operatorname{Act}(\pi(Q)) \cup \operatorname{Act}(\pi(R))$. Using the inductive hypothesis, $\operatorname{Act}(\pi(Q)) \subseteq \operatorname{Act}(Q)$ and $\operatorname{Act}(\pi(R)) \subseteq \operatorname{Act}(R)$, hence $\operatorname{Act}(\pi(P)) \subseteq \operatorname{Act}(Q) \cup$ $\operatorname{Act}(R)=\operatorname{Act}(Q \mid R)=\operatorname{Act}(P)$.
2. If $P \longrightarrow Q$ then $P \equiv \alpha \cdot Q_{1} \mid Q_{2}$ and $Q \equiv Q_{1} \mid Q_{2}$. Then $\operatorname{Act}(Q)=\operatorname{Act}\left(Q_{1}\right) \cup \operatorname{Act}\left(Q_{2}\right) \subseteq$ $\{\alpha\} \cup \operatorname{Act}\left(Q_{1}\right) \cup \operatorname{Act}\left(Q_{2}\right)=\operatorname{Act}(P)$.

Theorem 3.3. $\pi(\pi(P))=\pi(P)$.
Proof. We prove it by induction on $P$.
The case $P \equiv 0: \pi(\pi(0))=\pi(\{0\})=\pi(0)$
The case $P \equiv \alpha \cdot Q: \pi(\pi(\alpha \cdot Q))=\pi(\{0\} \cup \alpha . \pi(Q))=\pi(0) \cup \pi(\alpha . \pi(Q))=\{0\} \cup \alpha . \pi(\pi(Q))$. Now we can use the inductive hypothesis and we obtain $\pi(\pi(Q))=\pi(Q)$. Hence $\pi(\pi(\alpha . Q))=$ $\{0\} \cup \alpha . \pi(Q)=\pi(\alpha . Q)=\pi(P)$.
The case $P \equiv Q|R: \pi(\pi(P))=\pi(\pi(Q \mid R))=\pi(\pi(Q) \mid \pi(R))=\pi(\pi(Q))| \pi(\pi(R))$. Now we ca apply the inductive hypothesis on $Q$ and $R$ and obtain $\pi(\pi(P))=\pi(Q) \mid \pi(R)=\pi(Q \mid R)=$ $\pi(P)$.

Theorem 3.4. If $Q \in \pi(P)$ then $\pi(Q) \subset \pi(P)$.
Proof. $Q \in \pi(P)$ implies $\pi(Q) \subset \pi(\pi(P))$, and applying the theorem 3.3, we obtain $\pi(Q) \subset$ $\pi(P)$.

Theorem 3.5. If $\sigma$ is a substitution, then $\pi(\sigma(P))=\sigma(\pi(P))$.
Proof. We prove it by induction on $P$.
The case $P \equiv 0: \pi(\sigma(P))=\pi(0)=\{0\}=\sigma(\{0\})=\sigma(\pi(P))$.
The case $P \equiv \alpha \cdot Q: \pi(\sigma(P))=\pi(\sigma(\alpha) \cdot \sigma(Q))=\{0\} \cup \sigma(\alpha) \cdot \pi(\sigma(Q))$. But the inductive hypothesis gives $\pi(\sigma(Q))=\sigma(\pi(Q))$, hence

$$
\pi(\sigma(P))=\{0\} \cup \sigma(\alpha) \cdot \sigma(\pi(Q))
$$

from the other side, $\sigma(\pi(P))=\sigma(\{0\} \cup \alpha \cdot \pi(Q))=\{0\} \cup \sigma(\alpha) . \sigma(\pi(Q))$.
The case $P \equiv Q|R: \pi(\sigma(Q \mid R))=\pi(\sigma(Q) \mid \sigma(R))=\pi(\operatorname{sigma}(Q))| \pi(\sigma(R))$. But the inductive hypothesis gives $\pi(\sigma(Q))=\sigma(\pi(Q))$ and $\pi(\sigma(R))=\sigma(\pi(R))$. Hence $\pi(\sigma(P))=$ $\sigma(\pi(Q)) \mid \sigma(\pi(R))=\sigma(\pi(Q) \mid \pi(R))=\sigma(\pi(P))$.

These being proved, we can propose the definition of context:
Definition 3.3 (Context). A context is a nonempty set $\mathcal{M} \subseteq \mathfrak{P}$ of processes such that

- if $P \in \mathcal{M}$ and $P \longrightarrow P^{\prime}$ then $P^{\prime} \in \mathcal{M}$
- if $P \in \mathcal{M}$ then $\pi(P) \subset \mathcal{M}$

Theorem 3.6. If $\mathcal{M}$ is a context and $\sigma$ a substitution, then $\mathcal{M}^{\sigma}$ is a context.
Proof. Let $P \in \mathcal{M}^{\sigma}$. Then it exists a process $Q \in \mathcal{M}$ such that $\sigma(Q) \equiv P$. Then $\pi(P)=$ $\pi(\sigma(Q))$, and using theorem 3.5 we derive $\pi(P)=\sigma(\pi(Q))$. But $Q \in \mathcal{M}$ implies $\pi(Q) \subset \mathcal{M}$, thus $\sigma(\pi(Q)) \subset \mathcal{M}^{\sigma}$. Then $\pi(P) \subset \mathcal{M}^{\sigma}$.
Let $P \in \mathcal{M}^{\sigma}$ and $P \longrightarrow P^{\prime}$. Then it exists $Q \in \mathcal{M}$ such that $\sigma(Q) \equiv P$. Suppose that

$$
Q \equiv \alpha_{1} \cdot Q_{1}|\ldots| \alpha_{k} \cdot Q_{k}
$$

then

$$
P \equiv \sigma(Q) \equiv \sigma\left(\alpha_{1}\right) \cdot \sigma\left(Q_{1}\right)|\ldots| \sigma\left(\alpha_{k}\right) \cdot \sigma\left(Q_{k}\right)
$$

But then $P \longrightarrow P^{\prime}$ gives that it exists $i=1 . . k$ such that

$$
P^{\prime} \equiv \sigma\left(\alpha_{1}\right) \cdot \sigma\left(Q_{1}\right)|\ldots| \sigma\left(\alpha_{i-1}\right) \cdot \sigma\left(Q_{i-1}\right)\left|\sigma\left(Q_{i}\right)\right| \sigma\left(\alpha_{i+1}\right) \cdot \sigma\left(Q_{i+1}\right)|\ldots| \sigma\left(\alpha_{k}\right) \cdot \sigma\left(Q_{k}\right)
$$

and if we define

$$
Q^{\prime} \equiv \alpha_{1} \cdot Q_{1}|\ldots| \alpha_{i-1} \cdot Q_{i-1}\left|Q_{i}\right| \alpha_{i+1} \cdot Q_{i+1}|\ldots| \alpha_{k} \cdot Q_{k}
$$

we obtain $Q \longrightarrow Q^{\prime}$ (i.e. $\left.Q^{\prime} \in \mathcal{M}\right)$ and $\sigma\left(Q^{\prime}\right) \equiv P^{\prime}$. Hence $P^{\prime} \in \mathcal{M}^{\sigma}$.
Observe that, due to the closure clauses in definition 3.3, we can consider the possibility to define systems of generators for a context, as a class of processes that, using the rules in definition 3.3 can generate the full context.
Definition 3.4 (System of generators for a context). We say that the set $M \subset \mathfrak{P}$ is a system of generators for the context $\mathcal{M}$ if $\mathcal{M}$ is the smallest context that contains $M$. We denote this by $\bar{M}=\mathcal{M}$.

Theorem 3.7. If $M \in \mathfrak{P}$ is a finite set of processes, then $\bar{M}$ is a finite context.
Proof. Trivial.

### 3.1 Structural bisimulation on contexts

We extend the definitions of structural bisimulation from processes to contexts. This will allow us to prove the context pruning theorem, a result similar to the bound pruning theorem proved for processes.

Definition 3.5 (Structural bisimulation over contexts). Let $\mathcal{M}, \mathcal{N}$ be two contexts. We write $\mathcal{M} \approx_{h}^{w} \mathcal{N}$ iff

1. for any $P \in \mathcal{M}$ there is a $Q \in \mathcal{N}$ with $P \approx_{h}^{w} Q$
2. for any $Q \in \mathcal{N}$ there is a $P \in \mathcal{M}$ with $P \approx_{h}^{w} Q$

We convey to write $(\mathcal{M}, P) \approx_{h}^{w}(\mathcal{N}, Q)$ for the case when $P \in \mathcal{M}, Q \in \mathcal{N}, P \approx_{h}^{w} Q$ and $\mathcal{M} \approx_{h}^{w} \mathcal{N}$.

Theorem 3.8 (Antimonotonicity over contexts). If $\mathcal{M} \approx_{h}^{w} \mathcal{N}$ and $\left(h^{\prime}, w^{\prime}\right) \leq(h, w)$ then $\mathcal{M} \approx_{h^{\prime}}^{w^{\prime}} \mathcal{N}$.

Proof. For any process $P \in \mathcal{M}$ there exists a process $Q \in \mathcal{N}$ such that $P \approx_{h}^{w} Q$ and using theorem 2.3 we obtain $P \approx_{h^{\prime}}^{w^{\prime}} Q$. And the same if we start from a process $Q \in N$. These proves that $\mathcal{M} \approx_{h^{\prime}}^{w^{\prime}} \mathcal{N}$.

### 3.2 Pruning contexts

As for processes, we can define the pruning of a context $\mathcal{M}$ as the context generated by the set of pruned processes of $\mathcal{M}$, taken as system of generators.

Definition 3.6 (Pruning contexts). For any context $\mathcal{M}$ and any $(h, w)$ we define

$$
\mathcal{M}_{(h, w)} \stackrel{\text { def }}{=} \overline{\left\{P_{(h, w)} \mid P \in \mathcal{M}\right\}}
$$

Theorem 3.9. For any context $\mathcal{M}$, and any size $(h, w)$ we have $\mathcal{M}_{(h, w)} \approx_{w}^{h} \mathcal{M}$.
Proof. Denote by

$$
M=\left\{P_{(h, w)} \mid P \in \mathcal{M}\right\}
$$

Let $P \in \mathcal{M}$. Then it exists a process $Q \in \mathcal{M}_{(h, w)}$, more exactly $Q \equiv P_{(h, w)}$ such that $P \approx_{w}^{h} Q$. Let $Q \in \mathcal{M}_{(h, w)}$. Since $\bar{M}$ is the smallest context containing $M$, and because, by construction, $M \subseteq \mathcal{M}$ we derive that $\bar{M} \subseteq \mathcal{M}$. Hence, for any process $Q \in \bar{M}$ there is a process $P \in \mathcal{M}$, more exactly $P \equiv Q$ such that $P \approx_{w}^{h} Q$ (since $P \equiv Q$ implies $P \approx_{w}^{h} Q$ ).

Theorem 3.10. For any context $\mathcal{M}$ and any size $(h, w)$ we have $\operatorname{Act}\left(\mathcal{M}_{(h, w)}\right) \subseteq \operatorname{Act}(\mathcal{M})$.
Proof. As $P_{(h, w)} \in \pi(P)$ for any process $P \in \mathcal{M}$ and any $(h, w)$, by theorem 3.1, we obtain, by applying theorem 3.2, $\operatorname{Act}\left(P_{(h, w)}\right) \subseteq \operatorname{Act}(\mathcal{M})$, hence $\operatorname{Act}\left(\left\{P_{(h, w)} \mid P \in \mathcal{M}\right\}\right) \subseteq \operatorname{Act}(\mathcal{M})$. Further applying again theorem 3.2, we trivially derive the desired result.

Definition 3.7. Let $A \subset \mathbb{A}$. We denote by $\mathfrak{M}_{(h, w)}^{A}$ the set of all contexts generated by systems with the size at most $(h, w)$ and the actions in $A$ :

$$
\mathfrak{M}_{(h, w)}^{A} \stackrel{\text { def }}{=}\{\bar{M} \subset \mathfrak{P} \mid \operatorname{Act}(M) \subseteq A, \llbracket M \rrbracket \leq(h, w)\}
$$

Theorem 3.11. If $A \subset \mathbb{A}$ is a finite set of actions, then the following hold:

1. If $\mathcal{M} \in \mathfrak{M}_{(h, w)}^{A}$ then $\mathcal{M}$ is a finite context.
2. $\mathfrak{M}_{(h, w)}^{A}$ is finite.

Proof. 1.: If $\mathcal{M} \in \mathfrak{M}_{(h, w)}^{A}$ then $\mathcal{M}=\bar{M}, \llbracket M \rrbracket \leq(h, w)$ and $\operatorname{Act}(M) \subset A$. Thus $M \subset \mathfrak{P}_{(h, w)}^{A}$. But $\mathfrak{P}_{(h, w)}^{A}$ is finite, by theorem 2.14. Thus, by theorem $3.7, \bar{M}=\mathcal{M}$ is a finite context.
2.: As $\mathfrak{P}_{(h, w)}^{A}$ is finite by theorem 2.14 , the set of its subsets is finite, and as all the elements of $\mathfrak{M}_{(h, w)}^{A}$ are generated by subsets of $\mathfrak{P}_{(h, w)}^{A}$, we obtain that $\mathfrak{M}_{(h, w)}^{A}$ is finite.

Theorem 3.12 (Pruning theorem). Let $\mathcal{M}$ be a context. Then for any $(h, w)$ there is a context $\mathcal{N} \in \mathfrak{M}_{(h, w)}^{A c t(\mathcal{M})}$ such that $\mathcal{M} \approx_{h}^{w} \mathcal{N}$.

Proof. The context $\mathcal{N}=\mathcal{M}_{(h, w)}$ fulfills the requirements of the theorem, by construction. Indeed, it is a context, and it is generated by the set $N=\left\{P_{(h, w)} \mid P \in \mathcal{M}\right\}$. Moreover $\llbracket N \rrbracket \leq(h, w)$ and, by theorem 3.10, $\operatorname{Act}\left(\mathcal{M}_{(h, w)}\right) \subseteq \operatorname{Act}(\mathcal{M})$. Hence $\mathcal{N} \in \mathfrak{M}_{(h, w)}^{\text {Act }(\mathcal{M})}$.

## 4 Dynamic Epistemic Spatial Logic

In this section we introduce Dynamic Epistemic Spatial Logic, $\mathcal{L}_{D E S}^{\mathscr{S}}$, which extends HennessyMilner logic with the parallel operator and epistemic operators. The intuition is to define the knowledge of the process $P$ in the context $\mathcal{M}$ as the common properties of the processes in $\mathcal{M}$ that contain $P$ as subprocess. If we think to the epistemic agent as to an observer that can see only the process $P$, then its knowledge about any state of global system concerns only $P$. Thus, for it, the global states $P \mid Q$ and $P \mid R$ looks indistinguishable. Hence the knowledge implies a kind of universal quantifier over $\mathcal{M}$, since $K_{P} \phi$, if is satisfied by a process $P \mid Q$, then it is satisfied by any process $P \mid R \in \mathcal{M}$. We find this enough for expressing most of the properties considered in the spatial logic literature, which required the use of the guarantee operator.

By using the structural bisimulation and pruning method, we will prove the finite model property for $\mathcal{L}_{D E S}^{\mathfrak{S}}$ in relation to the semantics we considered. Consequently, we obtain decidability for satisfiability/validity and model checking.

For $\mathcal{L}_{D E S}^{\mathscr{G}}$ we will develop a Hilbert-style axiomatic system that will be proved to be sound and complete with respect to process semantics. Thus we identify the main axioms and rules that regularize the behavior of the classical, spatial, dynamic and epistemic logical operators. We will stress the similarities between our axioms and the classical axioms of epistemic logic, and we will prove some meaningful theorems.

Combined with the decidability, the properties of soundness and completeness make our logic a useful tool in analyzing complex multi-agent systems.

To introduce epistemic operators into our syntax we need to specify, for the beginning, the epistemic agents. As in classic epistemic logic, we may start with a class of agents, each agent pointing to a predefined subsystem (subprocess) of the system we consider. In this respect, we should consider quite a large class of agents, also for the processes that are not active in the current state but might be activated in future.

Hence for a system containing an agent associated with the process $\alpha . P \mid Q$, we might want to have also agents associated with $\alpha . P, P, P \mid Q$ and $Q$ respectively.

To avoid a syntax that is too complex, we decided to identify the agents with the processes they represent. Hence, in our logic the class of epistemic agents is just a subclass of $\mathfrak{P}$. We
will call this class signature, as it contains processes that will be part of the syntax as indexes of the epistemic agents. To denote the signature of our logic we will use the symbol $\mathfrak{S}$.

Definition 4.1 (Signature). A signature over $\mathfrak{P}$ is a set of processes $\mathfrak{S} \subset \mathfrak{P}$, hereafter called epistemic agents, satisfying the conditions:

- if $P \mid Q \in \mathfrak{S}$ then $P, Q \in \mathfrak{S}$
- if $P \in \mathfrak{S}$ and $P \longrightarrow Q$, then $Q \in \mathfrak{S}$

Observe that, by the previous definition, any signature $\mathfrak{S}$ contains 0 .

### 4.1 Syntax of $\mathcal{L}_{D E S}^{\mathscr{S}}$

Definition 4.2 (Syntax of $\mathcal{L}_{D E S}^{\mathfrak{S}}$ ). Let $\mathfrak{S}$ be a signature over $\mathfrak{P}$. We define the language of Dynamic Epistemic Spatial Logic over $\mathfrak{S}, \mathcal{F}_{D E S}^{\mathfrak{G}}$, by the following grammar:

$$
\phi:=0|\top| \neg \phi|\phi \wedge \phi| \phi|\phi|\langle\alpha\rangle \phi \mid K_{Q} \phi
$$

where $Q \in \mathfrak{S}$ and $\alpha \in \mathbb{A}$.
Anticipating the semantics, we will outline here the intuition that motivates the choice of the formulas. Mainly it is similar to that of Hennessy-Milner and spatial logics.

The formula 0 is meant to characterize any process structurally congruent with 0 (and only these) in any context, expressing "there is no activity here". It should not be confused with "false". ${ }^{9}$
$\top$ will be satisfied by any process in any context.
The reason for introducing the parallel operator $\phi \mid \psi$ is that we want to be able to express, as in other spatial logics, the situation in which our system is composed by two parallel subsystems, one satisfying $\phi$ and the other satisfying $\psi$.

The dynamic-like operator $\langle\alpha\rangle \phi$ is meant to be used, as in Hennessy-Milner logic, to speak about the transitions of our system. It expresses "the system may perform the action $\alpha$ thus meeting a state described by $\phi$ ".

We associate to each process $P \in \mathfrak{S}$ an epistemic operator $K_{P} \phi$ meaning the agent (process) $P$ knows $\phi$. Obviously, for our agents the notion of knowledge is different than in the standard approaches to intelligent agents, in the sense that we do not expect our agents to answer questions concerning their knowledge or to compute it. The knowledge of the agent $P$ in a context $\mathcal{M}$ is strictly related to the spectrum of actions $P$ can perform in this environment.

In our approach an inactive agent does not have a knowledge. This is an expected fact, as an inactive agent does not exist. Indeed, approaching systems from the point of view of behavior, to be is to behave. This aspect is new for the class of epistemic logic where, always, all the agents exist and know at least the tautologies.

Definition 4.3 (Derived operators). In addition we introduce some derived operators:

1. $\perp \stackrel{\text { def }}{=} \neg \top$
2. $\phi \vee \psi \stackrel{\text { def }}{=} \neg((\neg \phi) \wedge(\neg \psi))$
3. $\phi \rightarrow \psi \stackrel{\text { def }}{=}(\neg \phi) \vee \psi$
4. $[\alpha] \phi \stackrel{\text { def }}{=} \neg(\langle\alpha\rangle(\neg \phi))$
5. $1 \stackrel{\text { def }}{=} \neg((\neg 0) \mid(\neg 0))$
6. $\langle!\alpha\rangle \psi \stackrel{\text { def }}{=}(\langle\alpha\rangle \psi) \wedge 1$
7. $\widetilde{K}_{Q} \phi \stackrel{\text { def }}{=} \neg K_{Q} \neg \phi$
[^7]We could also introduce, for each action $\alpha$, a derived operator ${ }^{10}\langle\alpha, \bar{\alpha}\rangle$ to express communication by $\alpha$, supposing that we have defined an involution $c o: \mathbb{A} \longrightarrow \mathbb{A}$ which associates to each action $\alpha$ its co-action $\bar{\alpha}$ :

$$
\langle\alpha, \bar{\alpha}\rangle \phi \stackrel{\text { def }}{=} \bigvee_{\phi \leftrightarrow \phi_{1} \mid \phi_{2}}\langle\alpha\rangle \phi_{1} \mid\langle\bar{\alpha}\rangle \phi_{2}
$$

$\perp$ will be used to express the inconsistent behavior of the system. For this reason no process, in any context, will satisfy $\perp$.

The dynamic-like operator $[\alpha] \phi$, the dual operator of $\langle\alpha\rangle \phi$, expresses the situation where either the system cannot perform $\alpha$, or if the system can perform $\alpha$ then any future state that can be reached by performing $\alpha$ can be described by $\phi$.

The formula 1 is meant to describe the situation in which the system cannot be decomposed into two non-trivial subsystems. 1 can describe also the trivial system 0 .

The formula $\langle!\alpha\rangle \psi$ expresses a process guarded by $\alpha$, which, after consuming $\alpha$, will satisfy $\psi$.

Assumption. We convey that the precedence order of the operators in the syntax of $\mathcal{L}_{D E S}^{\mathscr{S}}$ is $\neg, K_{Q},\langle\alpha\rangle, \mid, \wedge, \vee, \rightarrow$ where $\neg$ has precedence over all the other operators.

### 4.2 Process semantics

A formula of $\mathcal{F}_{D E S}^{\mathfrak{S}}$ will be evaluated to processes in a given context, by mean of a satisfaction relation $\mathcal{M}, P \models \phi$.

Definition 4.4 (Models and satisfaction). A model of $\mathcal{L}_{D E S}^{\mathscr{S}}$ is a context $\mathcal{M}$ for which we define the satisfaction relation, for $P \in \mathcal{M}$, as follows:
$\mathcal{M}, P \models \top$ always
$\mathcal{M}, P \models 0$ iff $P \equiv 0$
$\mathcal{M}, P \models \neg \phi$ iff $\mathcal{M}, P \not \models \phi$
$\mathcal{M}, P \models \phi \wedge \psi$ iff $\mathcal{M}, P \models \phi$ and $\mathcal{M}, P \models \psi$
$\mathcal{M}, P \models \phi \mid \psi$ iff $P \equiv Q \mid R$ and $\mathcal{M}, Q \models \phi, \mathcal{M}, R \models \psi$
$\mathcal{M}, P \models\langle\alpha\rangle \phi$ iff there exists a transition $P \xrightarrow{\alpha} P^{\prime}$ and $\mathcal{M}, P^{\prime} \models \phi$
$\mathcal{M}, P \models K_{Q} \phi$ iff $P \equiv Q \mid R$ and $\forall Q \mid R^{\prime} \in \mathcal{M}$ we have $\mathcal{M}, Q \mid R^{\prime} \models \phi$
Then the semantics of the derived operators will be:
$\mathcal{M}, P \models[\alpha] \phi$ iff for any $P^{\prime} \in \mathcal{M}$ such that $P \xrightarrow{\alpha} P^{\prime}$ (if any), $\mathcal{M}, P^{\prime} \models \phi$
$\mathcal{M}, P \models 1$ iff $P \equiv 0$ or $P \equiv \alpha . Q$ ( $P$ is null or guarded)
$\mathcal{M}, P \models\langle!\alpha\rangle \phi$ iff $P \equiv \alpha . Q$ and $\mathcal{M}, Q \models \phi$
$\mathcal{M}, P \models K_{Q} \phi$ iff either $P \not \equiv Q \mid R$ for any $R$, or it exists $Q \mid S \in \mathcal{M}$ such that $\mathcal{M}, Q \mid S \models \phi$
Remark the interesting semantics of the operators $K_{0}$ and $\tilde{K}_{0}$ :
$\mathcal{M}, P \models K_{0} \phi$ iff for any $Q \in \mathcal{M}$ we have $\mathcal{M}, Q \models \phi$
$\mathcal{M}, P \models \widetilde{K}_{0} \phi$ iff it exists a process $Q \in \mathcal{M}$ such that $\mathcal{M}, Q \models \phi$
If a process $P \in \mathcal{M}$ satisfies $K_{0} \phi$ then $\phi$ is valid in $\mathcal{M}$ (the same about $K_{0} \phi$ ) and vice versa. Hence we can encode, in the syntax, the validity with respect to a given context.
If a process $P \in \mathcal{M}$ satisfies $\widetilde{K}_{0} \phi$ (then all the processes in $\mathcal{M}$ satisfy $\widetilde{K}_{0} \phi$ ) then it exists a process $Q \in \mathcal{M}$ that satisfies $\phi$ and vice versa. Hence $\widetilde{K}_{0} \phi$ provides a way to encode the satisfiability with respect to a given model.

In the end of this section we recall some classic definitions.

[^8]Definition 4.5. We call a formula $\phi \in \mathcal{F}_{D E S}^{\mathfrak{G}}$ satisfiable if there exists a context $\mathcal{M}$ and a process $P \in \mathcal{M}$ such that $\mathcal{M}, P \models \phi$.
We call a formula $\phi \in \mathcal{F}_{D E S}^{\mathscr{S}}$ validity if for any context $\mathcal{M}$ and any process $P \in \mathcal{M}$ we have $\mathcal{M}, P \models \phi$. In such a situation we write $\models \phi$.
Given a context $\mathcal{M}$, we denote by $\mathcal{M} \models \phi$ the situation when for any $P \in \mathcal{M}$ we have $\mathcal{M}, P \models \phi$.
Remark 4.1. $\phi$ is satisfiable iff $\neg \phi$ is not a validity, and vice versa, $\phi$ is a validity iff $\neg \phi$ is not satisfiable.

### 4.3 Finite model property and decidability

Now we prove the finite model property for our logic that will entail the decidability against the process semantics. To prove the finite model property means to prove that it exists, for a formula $\phi$, a finite class $C_{\phi}$ of couples $(\mathcal{M}, P)$ with $\mathcal{M}$ context and $P \in \mathcal{M}$ such that if $\phi$ is satisfiable then, necessarily, an element $(\mathcal{M}, P) \in C_{\phi}$ exists such that $\mathcal{M}, P \models \phi$. Anticipating, we define a size for $\phi$; then we prove that if $\mathcal{M}, P \models \phi$ then substituting, by $\sigma$, all the actions in $\mathcal{M}$ (and implicitly in $P$ ) that are not in the syntax of $\phi$ (as indexes of dynamic operators) by a fixed action with the same property, and then pruning $\mathcal{M}^{\sigma}$ and $P^{\sigma}$ to the size of $\phi$ we will obtain a couple $(\mathcal{N}, Q)$ such that $\mathcal{N}, Q \models \phi$. The fixed action of substitution can be chosen as the successor ${ }^{11}$ of the maximum action of $\phi$, which is unique. Hence $\mathcal{N} \in \mathfrak{M}_{(h, w)}^{A}$ where $(h, w)$ is the size of $\phi$ and $A$ is the set of actions of $\phi$ augmented with the successor of its maximum, thus $A$ is finite. But then theorem 3.11 ensures that the set of pairs $(\mathcal{N}, Q)$, with this property, is finite.

Definition 4.6 (Size of a formula). We define the sizes of a formula, ( $\phi \phi$ (height and width), inductively on $\mathcal{F}_{D E S}^{\mathfrak{G}}$, by:

1. $(0)=(T) \stackrel{\text { def }}{=}(0,0)$
2. $(\neg \phi) \stackrel{\text { def }}{=}(\phi)$
and supposing that $(\phi)=(h, w),(\psi)=\left(h^{\prime}, w^{\prime}\right)$ and $\llbracket R \rrbracket=\left(h_{R}, w_{R}\right)$ we define further:
3. $(\phi \wedge \psi\rangle \stackrel{\text { def }}{=}\left(\max \left(h, h^{\prime}\right), \max \left(w, w^{\prime}\right)\right)$
4. $(\phi|\psi|) \stackrel{\text { def }}{=}\left(\max \left(h, h^{\prime}\right), w+w^{\prime}\right)$
5. $\langle\langle\alpha\rangle \phi\rangle \stackrel{\text { def }}{=}(1+h, 1+w)$
6. $\left(K_{R} \phi\right) \stackrel{\text { def }}{=}\left(1+\max \left(h, h_{R}\right), 1+\max \left(w, w_{R}\right)\right)$

The next theorem states that $\phi$ is "sensitive" via satisfaction only up to size ( $\phi()$. In other words, the relation $\mathcal{M}, P \models \phi$ is conserved by substituting the couple $(M, P)$ with any other couple $(N, P)$ structurally bisimilar to it at the size $(\phi)$.

Definition 4.7 (Extending the structural bisimulation). We write $(\mathcal{M}, P) \approx_{h}^{w}(\mathcal{N}, Q)$ for the case when $P \in \mathcal{M}, Q \in \mathcal{N}, P \approx_{h}^{w} Q$ and $\mathcal{M} \approx_{h}^{w} \mathcal{N}$.

Lemma 4.1. If $(\phi)=(h, w), \mathcal{M}, P \models \phi$ and $(\mathcal{M}, P) \approx_{h}^{w}(\mathcal{N}, Q)$ then $\mathcal{N}, Q \models \phi$.
Proof. We prove it by induction on the syntactical structure of $\phi$.

- The case $\phi=0$ : $(\phi)=(1,1)$. $\mathcal{M}, P \models 0$ implies $P \equiv 0$. As $P \approx_{1}^{1} Q$ we should have $Q \equiv 0$ as well, because else $Q \equiv \alpha \cdot Q^{\prime} \mid Q^{\prime \prime}$ asks for $P \equiv \alpha \cdot P^{\prime} \mid P^{\prime \prime}$ for some $P^{\prime}, P^{\prime \prime}$, but this is impossible because $P \equiv 0$.
So $Q \equiv 0 \in \mathcal{N}$ and we have $\mathcal{N}, Q \models 0$, q.e.d.
- The case $\phi=\top$ : is a trivial case as $\mathcal{N}, Q \models \top$ always.

[^9]- The case $\phi=\phi_{1} \wedge \phi_{2}$ : denote by $\left(h_{i}, w_{i}\right)=\left(\phi_{i}\right)$ for $i=1,2$. Then we have $(\phi)=$ $\left(\max \left(h_{1}, h_{2}\right), \max \left(w_{1}, w_{2}\right)\right)$.
$\mathcal{M}, P \models \phi$ is equivalent with $\mathcal{M}, P \models \phi_{1}$ and $\mathcal{M}, P \models \phi_{2}$.
Because $(\mathcal{M}, P) \approx_{\max \left(h_{1}, h_{2}\right)}^{\max \left(w_{1}, w_{2}\right.}(\mathcal{N}, Q)$ we obtain, by using theorem 3.8, that $(\mathcal{M}, P) \approx_{h_{1}}^{w_{1}}$ $(\mathcal{N}, Q)$ and $(\mathcal{M}, P) \approx_{h_{2}}^{w_{2}}(\mathcal{N}, Q)$.
Now $(\mathcal{M}, P) \approx_{h_{1}}^{w_{1}}(\mathcal{N}, Q)$ and $\mathcal{M}, P \models \phi_{1}$ give, by inductive hypothesis, $\mathcal{N}, Q \models \phi_{1}$, while $(\mathcal{M}, P) \approx_{h_{2}}^{w_{2}}(\mathcal{N}, Q)$ and $\mathcal{M}, P \models \phi_{2}$ give, by inductive hypothesis $\mathcal{N}, Q \models \phi_{2}$. Hence $\mathcal{N}, Q \models \phi_{1} \wedge \phi_{2}$, q.e.d.
- The case $\phi=\neg \phi^{\prime}:(\phi)=\left(\phi^{\prime}\right)=(h, w)$.

We have $\mathcal{M}, P \models \neg \phi^{\prime}$ and $(\mathcal{M}, P) \approx_{h}^{w}(\mathcal{N}, Q)$.
If $\mathcal{N}, Q \not \vDash \neg \phi^{\prime}$, then $\mathcal{N}, Q \models \neg \neg \phi^{\prime}$, i.e. $\mathcal{N}, Q \models \phi^{\prime}$.
Because $(\mathcal{M}, P) \approx_{h}^{w}(\mathcal{N}, Q)$ and $\mathcal{N}, Q \models \phi^{\prime}$, the inductive hypothesis gives that $\mathcal{M}, P \models$ $\phi^{\prime}$, which combined with $\mathcal{M}, P \models \neg \phi^{\prime}$ gives $\mathcal{M}, P \models \perp$ - impossible. Hence $\mathcal{N}, Q \models \neg \phi^{\prime}$.

- The case $\phi=\phi_{1} \mid \phi_{2}$ : suppose that $\left(\phi_{i}\right)=\left(h_{i}, w_{i}\right)$ for $i=1,2$. Then $(\phi)=\left(\max \left(h_{1}, h_{2}\right), w_{1}+\right.$ $w_{2}$ ).
Further, $\mathcal{M}, P \models \phi_{1} \mid \phi_{2}$ requires $P \equiv P_{1} \mid P_{2}$, with $\mathcal{M}, P_{1} \models \phi_{1}$ and $\mathcal{M}, P_{2} \models \phi_{2}$.
As $(\mathcal{M}, P) \approx_{\max \left(h_{1}, h_{2}\right)}^{w_{1}+w_{2}}(\mathcal{N}, Q)$ we obtain $P \approx_{\max \left(h_{1}, h_{2}\right)}^{w_{1}+w_{2}} Q$. Than, from $P \equiv P_{1} \mid P_{2}$, using theorem 2.5, we obtain $Q \equiv Q_{1} \mid Q_{2}$ and $P_{i} \approx_{\max \left(h_{1}, h_{2}\right)}^{w_{i}} Q_{i}$ for $i=1,2$. Hence, using theorem 3.8,
$\left(\mathcal{M}, P_{i}\right) \approx_{\max \left(h_{1}, h_{2}\right)}^{w_{i}}\left(\mathcal{N}, Q_{i}\right)$. Further, using again theorem 3.8, we obtain $\left(\mathcal{M}, P_{i}\right) \approx_{h_{i}}^{w_{i}}$ $\left(\mathcal{N}, Q_{i}\right)$, and using the inductive hypothesis,
$\mathcal{N}, Q_{1} \models \phi_{1}$ and $\mathcal{N}, Q_{2} \models \phi_{2}$. Hence $\mathcal{N}, Q \models \phi$.
- The case $\phi=\langle\alpha\rangle \phi^{\prime}$ : suppose that $\left(\phi^{\prime}\right\rangle=\left(h^{\prime}, w^{\prime}\right)$. We have $\left(\langle\alpha\rangle \phi^{\prime}\right)=\left(1+h^{\prime}, 1+w^{\prime}\right)$.
$\mathcal{M}, P \models\langle\alpha\rangle \phi^{\prime}$ means that $P \xrightarrow{\alpha} P^{\prime}$ and $\mathcal{M}, P^{\prime} \models \phi^{\prime}$.
Now $(\mathcal{M}, P) \approx_{1+h^{\prime}}^{1+w^{\prime}}(\mathcal{N}, Q)$ gives $P \approx_{1+h^{\prime}}^{1+w^{\prime}} Q$, and using theorem 2.10, we obtain that $Q \xrightarrow{\alpha} Q^{\prime}$ and $P^{\prime} \approx_{h^{\prime}}^{w^{\prime}} Q^{\prime}$.
But $(\mathcal{M}, P) \approx_{1+h^{\prime}}^{1+w^{\prime}}(\mathcal{N}, Q)$ gives also $\mathcal{M} \approx_{h^{\prime}+1}^{w^{\prime}+1} \mathcal{N}$, so using theorem 3.8, $\mathcal{M} \approx_{h^{\prime}}^{w^{\prime}} \mathcal{N}$. Hence $\left(\mathcal{M}, P^{\prime}\right) \approx_{h^{\prime}}^{w^{\prime}}\left(\mathcal{N}, Q^{\prime}\right)$.
Now from $\mathcal{M}, P^{\prime} \models \phi^{\prime}$ and $\left(\mathcal{M}, P^{\prime}\right) \approx_{h^{\prime}}^{w^{\prime}}\left(\mathcal{N}, Q^{\prime}\right)$, we obtain, by using the inductive hypothesis, that $\mathcal{N}, Q^{\prime} \models \phi^{\prime}$, and as $Q \xrightarrow{\alpha} Q^{\prime}$, we obtain further that $\mathcal{N}, Q \models \phi$.
- The case $\phi=K_{R} \phi^{\prime}$ with $R \in \mathfrak{S}$ : suppose that $\left(\phi^{\prime}\right)=\left(h^{\prime}, w^{\prime}\right)$ and $\llbracket R \rrbracket=\left(h_{R}, w_{R}\right)$.

Then $\left(K_{R} \phi^{\prime}\right)=\left(1+\max \left(h^{\prime}, h_{R}\right), 1+\max \left(w^{\prime}, w_{R}\right)\right)$.
Now $\mathcal{M}, P \models K_{R} \phi^{\prime}$ gives $P \equiv R \mid P^{\prime}$ and for any $R \mid S \in \mathcal{M}$ we have $\mathcal{M}, R|S|=\phi^{\prime}$.
As $(\mathcal{M}, P) \approx_{1+\max \left(h^{\prime}, h_{R}\right)}^{1+\max \left(w^{\prime}\right)}(\mathcal{N}, Q)$ then $P \approx_{1+\max \left(h^{\prime}, h_{R}\right)}^{1+\max \left(w^{\prime}, w_{2}\right)} Q$ and because $P \equiv R \mid P^{\prime}$ and $\llbracket R \rrbracket=\left(h_{R}, w_{R}\right)<\left(1+\max \left(h^{\prime}, h_{R}\right), 1+\max \left(w^{\prime}, w_{R}\right)\right)$, we obtain, using theorem 2.7 , that $Q \equiv R \mid Q^{\prime}$.

Let $R \mid S^{\prime} \in \mathcal{N}$ be an arbitrary process. Because $\mathcal{M} \approx_{1+\max \left(h^{\prime}, h_{R}\right)}^{1+\max \left(w^{\prime}, w_{R}\right)} \mathcal{N}$ we obtain that exists a process $P^{\prime \prime} \in \mathcal{M}$ such that $P^{\prime \prime} \approx_{1+\max \left(h^{\prime}, h_{R}\right)}^{1+\max \left(w^{\prime}, w_{R}\right)} R \mid S^{\prime}$. But $\llbracket R \rrbracket<\left(1+\max \left(h^{\prime}, h_{R}\right), 1+\right.$ $\max \left(w^{\prime}, w_{R}\right)$ ), so, using theorem $2.7, P^{\prime \prime} \equiv R \mid S^{\prime \prime}$.
Then $\mathcal{M}, R \mid S^{\prime \prime} \models \phi^{\prime}$, as $\mathcal{M}, R \mid S \models \phi^{\prime}$ for any $R \mid S \in \mathcal{M}$.

From the other side, $(\mathcal{M}, P) \approx_{1+\max \left(h^{\prime}, h_{R}\right)}^{1+\max \left(w^{\prime}, w^{\prime}\right)}(\mathcal{N}, Q)$ gives, using theorem $3.8,(\mathcal{M}, P) \approx_{h^{\prime}}^{w^{\prime}}$ $(\mathcal{N}, Q)$ where from we obtain $\mathcal{M} \approx_{h^{\prime}}^{w^{\prime}} \mathcal{N}$.
Also $R\left|S^{\prime \prime} \approx_{1+\max \left(h^{\prime}, h_{R}\right)}^{1+\max \left(w^{\prime}, w_{R}\right)} R\right| S^{\prime}$ gives $R\left|S^{\prime \prime} \approx_{h^{\prime}}^{w^{\prime}} R\right| S^{\prime}$, i.e. $\left(\mathcal{M}, R \mid S^{\prime \prime}\right) \approx_{h^{\prime}}^{w^{\prime}}\left(\mathcal{N}, R \mid S^{\prime}\right)$.
Now $\mathcal{M}, R\left|S^{\prime \prime}\right|=\phi^{\prime}$ and $\left(\mathcal{M}, R \mid S^{\prime \prime}\right) \approx_{h^{\prime}}^{w^{\prime}}\left(\mathcal{N}, R \mid S^{\prime}\right)$ give, using the inductive hypothesis, that $\mathcal{N}, R \mid S^{\prime} \models \phi^{\prime}$.
Concluding, we obtained that $Q \equiv R \mid Q^{\prime}$ and for any $R \mid S^{\prime} \in \mathcal{N}$ we have $\mathcal{N}, R \mid S^{\prime} \models \phi^{\prime}$. These two give $\mathcal{N}, Q \models K_{R} \phi^{\prime}$ q.e.d.

Now, using this lemma, we conclude that if a process, in a context, satisfies $\phi$ then by pruning the process and the context on the size $(\phi)$, we still have satisfiability for $\phi$.

Theorem 4.2. If $\mathcal{M}, P \models \phi$ then $\mathcal{M}_{(\phi\rangle}, P_{(\phi)} \models \phi$.
Proof. Let $(\phi)=(h, w)$. By contexts pruning theorem 3.12, we have $\mathcal{M} \approx_{w}^{h} \mathcal{M}_{(h, w)}$. By process pruning theorem 2.11, we have $P \approx_{w}^{h} P_{(h, w)}$ and $P_{(h, w)} \in \mathcal{M}_{(h, w)}$. Hence $(\mathcal{M}, P) \approx_{w}^{h}$ $\left(\mathcal{M}_{(h, w)}, P_{(h, w)}\right)$. Further lemma 4.1 establishes $\mathcal{M}_{(h, w)}, P_{(h, w)} \models \phi$ q.e.d.

Definition 4.8 (The set of actions of a formula). We define the set of actions of a formula $\phi, \operatorname{act}(\phi) \subset \mathbb{A}$, inductively by:

1. $\operatorname{act}(0) \stackrel{\text { def }}{=} \emptyset$
2. $\operatorname{act}(T) \stackrel{\text { def }}{=} \emptyset$
3. $\operatorname{act}(\phi \wedge \psi)=\operatorname{act}(\phi \mid \psi) \stackrel{\text { def }}{=} \operatorname{act}(\phi) \cup \operatorname{act}(\psi)$
4. $\operatorname{act}(\neg \phi)=\operatorname{act}(\phi)$
5. $\operatorname{act}\left(K_{R} \phi\right) \stackrel{\text { def }}{=} \operatorname{Act}(R) \cup \operatorname{act}(\phi)$
6. $\operatorname{act}(\langle\alpha\rangle \phi) \stackrel{\text { def }}{=}\{\alpha\} \cup \operatorname{act}(\phi)$

The next result states that a formula $\phi$ does not reflect properties that involves more then the actions in its syntax. Thus if $\mathcal{M}, P \models \phi$ then any substitution $\sigma$ having the elements of $\operatorname{act}(\phi)$ as fix points preserves the satisfaction relation, i.e. $\mathcal{M}^{\sigma}, P^{\sigma}=\phi$.

Theorem 4.3. If $\mathcal{M}, P \models \phi$ and $\sigma$ is a substitution with $\operatorname{act}(\sigma) \bigcap \operatorname{act}(\phi)=\emptyset$ then $\mathcal{M}^{\sigma}, P^{\sigma} \models \phi$.
Proof. We prove, simultaneously, by induction on $\phi$, that

1. if $\mathcal{M}, P \models \phi$ then $\sigma(\mathcal{M}), \sigma(P) \models \phi$
2. if $\mathcal{M}, P \not \vDash \phi$ then $\sigma(\mathcal{M}), \sigma(P) \not \models \phi$

The case $\phi=0$ :

1. $\mathcal{M}, P \models 0$ iff $P \equiv 0$. Then $\sigma(P) \equiv 0$ and $\sigma(\mathcal{M}), \sigma(0) \models 0$ q.e.d.
2. $\mathcal{M}, P \not \vDash 0$ iff $P \not \equiv 0$, iff $\sigma(P) \not \equiv 0$. Hence $\sigma(\mathcal{M}), \sigma(P) \not \vDash 0$.

The case $\phi=\top$ :

1. $\mathcal{M}, P \models \top$ implies $\sigma(\mathcal{M}), \sigma(P) \models \top$, because this is happening for any context and process.
2. $\mathcal{M}, P \not \vDash \top$ is an impossible case.

The case $\phi=\psi_{1} \wedge \psi_{2}$ :

1. $\mathcal{M}, P \models \psi_{1} \wedge \psi_{2}$ implies that $\mathcal{M}, P \models \psi_{1}$ and $\mathcal{M}, P \models \psi_{2}$. Because $\operatorname{act}(\sigma) \cap \operatorname{act}(\phi)=\emptyset$ we derive that $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{1}\right)=\emptyset$ and $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{2}\right)=\emptyset$. Further, applying the inductive hypothesis, we obtain $\mathcal{M}^{\sigma}, P^{\sigma} \models \psi_{1}$ and $\mathcal{M}^{\sigma}, P^{\sigma} \models \psi_{2}$ that implies $\mathcal{M}^{\sigma}, P^{\sigma} \models \psi_{1} \wedge \psi_{2}$.
2. $\mathcal{M}, P \not \vDash \psi_{1} \wedge \psi_{2}$ implies that $\mathcal{M}, P \not \vDash \psi_{1}$ or $\mathcal{M}, P \not \vDash \psi_{2}$. But, as argued before, $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{1}\right)=\emptyset$ and $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{2}\right)=\emptyset$, hence we can apply the inductive hypothesis that entails $\mathcal{M}^{\sigma}, P^{\sigma} \notin \psi_{1}$ or $\mathcal{M}^{\sigma}, P^{\sigma} \notin \psi_{2}$. Thus $\mathcal{M}^{\sigma}, P^{\sigma} \not \vDash \psi_{1} \wedge \psi_{2}$.

The case $\phi=\neg \psi$ :

1. $\mathcal{M}, P \models \neg \psi$ is equivalent with $\mathcal{M}, P \not \vDash \psi$ and because $\operatorname{act}(\sigma) \cap \operatorname{act}(\phi)=\emptyset$ guarantees that $\operatorname{act}(\sigma) \cap \operatorname{act}(\psi)=\emptyset$, we ca apply the inductive hypothesis and we obtain $\sigma(\mathcal{M}), \sigma(P) \not \vDash \psi$ which is equivalent with $\sigma(\mathcal{M}), \sigma(P) \models \neg \psi$.
2. $\mathcal{M}, P \not \models \neg \psi$ is equivalent with $\mathcal{M}, P \models \psi$ and applying the inductive hypothesis, $\sigma(\mathcal{M}), \sigma(P) \models$ $\psi$, i.e. $\sigma(\mathcal{M}), \sigma(P) \not \models \neg \psi$.

The case $\phi=\psi_{1} \mid \psi_{2}$ :

1. $\mathcal{M}, P \models \psi_{1} \mid \psi_{2}$ implies that $P \equiv Q \mid R, \mathcal{M}, Q \models \psi_{1}$ and $\mathcal{M}, R \models \psi_{2}$. As $\operatorname{act}(\sigma) \cap \operatorname{act}(\phi)=\emptyset$ we have $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{1}\right)=\emptyset$ and $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{2}\right)=\emptyset$. Then we can apply the inductive hypothesis and obtain $\sigma(\mathcal{M}), \sigma(Q) \models \psi_{1}$ and $\sigma(\mathcal{M}), \sigma(R) \models \psi_{2}$. But $\sigma(P) \equiv \sigma(Q) \mid \sigma(R)$, hence $\sigma(\mathcal{M}), \sigma(P) \models \phi$.
2. $\mathcal{M}, P \not \vDash \psi_{1} \mid \psi_{2}$ implies that for any decomposition $P \equiv Q \mid R$ we have either $\mathcal{M}, Q \not \vDash \psi_{1}$ or $\mathcal{M}, R \not \vDash \psi_{2}$. But, as before, from $\operatorname{act}(\sigma) \cap \operatorname{act}(\phi)=\emptyset$ guarantees that $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{1}\right)=\emptyset$ and $\operatorname{act}(\sigma) \cap \operatorname{act}\left(\psi_{2}\right)=\emptyset$. Hence, we can apply the inductive hypothesis and consequently, for any decomposition $P \equiv Q \mid R$ we have either $\sigma(\mathcal{M}), \sigma(Q) \not \vDash \psi_{1}$ or $\sigma(\mathcal{M}), \sigma(R) \not \vDash \psi_{2}$. Consider any arbitrary decomposition $\sigma(P) \equiv P^{\prime} \mid P^{\prime \prime}$. By theorem 2.17, there exists $P \equiv$ $Q \mid R$ such that $\sigma(Q) \equiv P^{\prime}$ and $\sigma(R) \equiv P^{\prime \prime}$. Thus either $\sigma(\mathcal{M}), P^{\prime} \notin \psi_{1}$ or $\sigma(\mathcal{M}), P^{\prime \prime} \not \vDash \psi_{2}$. Hence $\sigma(\mathcal{M}), \sigma(P) \not \models \psi_{1} \mid \psi_{2}$.

The case $\phi=\langle\gamma\rangle \psi$ :

1. $\mathcal{M}, P \vDash\langle\gamma\rangle \psi$ means that there is a transition $P \xrightarrow{\gamma} Q$ and $\mathcal{M}, Q \vDash \psi$. Because $\operatorname{act}(\sigma) \cap \operatorname{act}(\langle\gamma\rangle \psi)=\emptyset$ implies $\operatorname{act}(\sigma) \cap \operatorname{act}(\psi)=\emptyset$. We can apply the inductive hypothesis and derive $\sigma(\mathcal{M}), \sigma(Q) \models \psi$. As $P \xrightarrow{\gamma} Q$ we have $P \equiv \gamma \cdot P^{\prime} \mid P^{\prime \prime}$ and $Q \equiv P^{\prime} \mid P^{\prime \prime}$. This mean that $\sigma(P) \equiv \sigma(\gamma) \cdot \sigma\left(P^{\prime}\right) \mid \sigma\left(P^{\prime \prime}\right)$. Now $\operatorname{act}(\sigma) \cap \operatorname{act}(\langle\gamma\rangle \psi)=\emptyset$ ensures that $\sigma(\gamma)=\gamma$. So $\sigma(P) \equiv \gamma \cdot \sigma\left(P^{\prime}\right) \mid \sigma\left(P^{\prime \prime}\right)$ and $\sigma(Q) \equiv \sigma\left(P^{\prime}\right) \mid \sigma\left(P^{\prime \prime}\right)$. Hence $\sigma(P) \xrightarrow{\gamma} \sigma(Q)$. Now because $\sigma(\mathcal{M}), \sigma(Q) \models \psi$, we derive $\sigma(\mathcal{M}), \sigma(P) \models\langle\gamma\rangle \psi$.
2. $\mathcal{M}, P \not \vDash\langle\gamma\rangle \psi$ implies one of two cases: either there is no transition of $P$ by $\gamma$, or there is such a transition and for any transition $P \xrightarrow{\gamma} Q$ we have $\mathcal{M}, Q \not \vDash \psi$.
If there is no transition of $P$ by $\gamma$ then $P \equiv \alpha_{1} . P_{1}|\ldots| \alpha_{k} . P_{k}$ with $\alpha_{i} \neq \gamma$ for each $i \neq 1 . . k$. Because $\sigma(P) \equiv \sigma\left(\alpha_{1}\right) \cdot \sigma\left(P_{1}\right)|\ldots| \sigma\left(\alpha_{k}\right) \cdot \sigma\left(P_{k}\right)$, and because $\gamma \neq \alpha_{i}$, and $\gamma \notin \operatorname{act}(\sigma)$, we can state that $\gamma \neq \sigma\left(\alpha_{i}\right)$, hence $\sigma(P)$ cannot perform a transition by $\gamma$. Thus $\sigma(\mathcal{M}), \sigma(P) \not \vDash$ $\langle\gamma\rangle \psi$.
If there are transitions of $P$ by $\gamma$, and for any such a transition $P \xrightarrow{\gamma} Q$ we have $\mathcal{M}, Q \not \vDash \psi$ : then, because from $\operatorname{act}(\sigma) \cap \operatorname{act}(\langle\gamma\rangle \psi)=\emptyset$ we can derive $\operatorname{act}(\sigma) \cap \operatorname{act}(\psi)=\emptyset$, the inductive hypothesis can be applied and we obtain $\sigma(\mathcal{M}), \sigma(Q) \not \vDash \psi$. But because $\gamma \notin \operatorname{act}(\sigma)$ we obtain $\sigma(\gamma)=\gamma$ and $\sigma(P) \xrightarrow{\gamma} \sigma(Q)$. Hence $\sigma(\mathcal{M}), \sigma(P) \not \vDash\langle\gamma\rangle \psi$.

The case $\phi=K_{R} \psi$ :

1. $\mathcal{M}, P \models K_{R} \psi$ implies $P \equiv R \mid S$ and for any $R \mid S^{\prime} \in \mathcal{M}$ we have $\mathcal{M}, R \mid S^{\prime} \models \psi$. From $\operatorname{act}(\sigma) \cap \operatorname{act}(\phi)=\emptyset$ we derive $\operatorname{act}(\sigma) \cap \operatorname{act}(\psi)=\emptyset$ and $\operatorname{act}(\sigma) \cap \operatorname{Act}(R)=\emptyset$. So, we can apply the inductive hypothesis that gives $\mathcal{M}^{\sigma}, \sigma\left(R \mid S^{\prime}\right) \models \psi$ and, because $\sigma(R) \equiv R$, $M^{\sigma}, R \mid \sigma\left(S^{\prime}\right) \models \psi$.
Consider an arbitrary process $R \mid S^{\prime \prime} \in \mathcal{M}^{\sigma}$. There exists a process $Q \in \mathcal{M}$ such that $\sigma(Q) \equiv R \mid S^{\prime \prime}$. Thus, by theorem $2.17, Q \equiv R^{\prime} \mid S^{\prime \prime \prime}$ with $\sigma\left(R^{\prime}\right)=R$ and $\sigma\left(S^{\prime \prime \prime}\right)=S^{\prime \prime}$. But $\operatorname{Act}(R) \cap \operatorname{act}(\sigma)=\emptyset$ implies $\operatorname{Act}(R) \cap \operatorname{obj}(\sigma)=\emptyset$, so applying the theorem 2.16, we derive $R \equiv R^{\prime}$. Thus $Q \equiv R \mid S^{\prime \prime \prime}$ and because $\mathcal{M}^{\sigma}, R \mid \sigma\left(S^{\prime}\right) \models \psi$ for any $S^{\prime}$, we derive $\mathcal{M}^{\sigma}, R \mid S^{\prime \prime} \models \psi$.
Because $R \mid S^{\prime \prime} \in \mathcal{M}^{\sigma}$ was arbitrarily chosen, and because $\sigma(P)=\sigma(R \mid S)=R \mid \sigma(S)$, we obtain $\mathcal{M}^{\sigma}, P^{\sigma} \models K_{R} \psi$.
2. $\mathcal{M}, P \not \vDash K_{R} \psi$ implies that either $P \not \equiv R \mid S$ for any $S$, or $P \equiv R \mid S$ for some $S$ and there exists a process $R \mid S^{\prime} \in \mathcal{M}$ such that $\mathcal{M}, R \mid S^{\prime} \not \vDash \psi$.
If $P \not \equiv R \mid P^{\prime}$, because $\operatorname{act}(\sigma) \cap \operatorname{Act}(R)=\emptyset$ implies $\operatorname{obj}(\sigma) \cap \operatorname{Act}(R)=\emptyset$ we derive, by theorem 2.18, that $\sigma(P) \not \equiv R \mid S$ for any $S$. Hence, we can state that $\mathcal{M}^{\sigma}, P^{\sigma} \not \equiv K_{R} \psi$.
If $P \equiv R \mid S$ for some $S$ and there exists a process $R \mid S^{\prime} \in \mathcal{M}$ such that $\mathcal{M}, R \mid S^{\prime} \notin \psi$, then the inductive hypothesis gives $\mathcal{M}^{\sigma}, \sigma(R) \mid \sigma\left(S^{\prime}\right) \not \vDash \psi$. But $\sigma(R)\left|\sigma\left(S^{\prime}\right) \equiv R\right| \sigma\left(S^{\prime}\right)$, and $\sigma(P) \equiv R \mid \sigma(S)$ thus $\sigma(\mathcal{M}), R \mid \sigma\left(S^{\prime}\right) \not \vDash \psi$ implies $\sigma(\mathcal{M}), \sigma(P) \not \vDash K_{R} \psi$.

We suppose to have defined on $\mathbb{A}$ a lexicographical order $\ll$. So, for a finite set $A \subset \mathbb{A}$ we can identify a maximal element that is unique. Hence the successor of this element is unique as well. We convey to denote by $A_{+}$the set obtained by adding to $A$ the successor of its maximal element.

## Theorem 4.4 (Finite model property).

$$
\text { If } \mathcal{M}, P \models \phi \text { then } \exists \mathcal{N} \in \mathfrak{M}_{(\phi)}^{a c t(\phi)_{+}} \text {and } Q \in \mathcal{N} \text { such that } \mathcal{N}, Q=\phi
$$

Proof. Consider the substitution $\sigma$ that maps all the actions $\alpha \in \mathbb{A} \backslash \operatorname{act}(\phi)$ in the successor of the maximum element of $\operatorname{act}(\phi)$ (it exists as $\operatorname{act}(\phi)$ is finite). Obviously $\operatorname{act}(\sigma) \cap \operatorname{act}(\phi)=\emptyset$, hence, using theorem 4.3 we obtain $\mathcal{M}^{\sigma}, P^{\sigma} \models \phi$. Further we take $\mathcal{N}=\mathcal{M}_{(h, w)}^{\sigma} \in \mathfrak{M}_{(h, w)}^{a c t(\phi)^{+}}$ and $Q=P_{(h, w)}^{\sigma} \in \mathcal{M}_{(h, w)}^{a c t(\phi)^{+}}$, and theorem 4.1 proves the finite model property.

Because $\operatorname{act}(\phi)$ is finite implying $\operatorname{act}(\phi)_{+}$finite, we apply theorem 3.11 ensuring that $\mathfrak{M}_{(\phi \emptyset)}^{a c t(\phi)_{+}}$ is finite and any context $\mathcal{M} \in \mathfrak{M}_{(\phi \emptyset}^{a c t(\phi)_{+}}$is finite as well. Thus we obtain the finite model property for our logic. A consequence of theorem 4.4 is the decidability for satisfiability, validity and model checking against the process semantics.

Theorem 4.5 (Decidability). For $\mathcal{L}_{D E S}^{\mathscr{S}}$ validity, satisfiability and model checking are decidable against the process semantics.

### 4.4 Axioms of $\mathcal{L}_{D E S}^{\mathfrak{S}}$

Now we propose a Hilbert-style axiomatic system for Dynamic Epistemic Spatial Logic, $\mathcal{L}_{D E S}^{\mathfrak{S}}$. The system will be constructed in top of the classical propositional logic. Hence all the axioms and rules of propositional logic are available. In addition we will have a class of spatial axioms and rules that describes, mainly, the behavior of the parallel operator, a class of dynamic axioms and rules regarding the behavior of the dynamic operators, and a class of epistemic axioms and
rules focusing on the behavior of epistemic operators. In the next subsections we will prove that the system is sound and complete with respect to process semantics.

We begin by defining, inductively on processes, some special classes of formulas that, will be proved further, characterize processes and finite contexts.
Definition 4.9 (Characteristic formulas for processes). We define a class of formulas $\left(c_{P}\right)_{P \in \mathfrak{P}}$, indexed by (三-equivalence classes of) processes, as follows:

1. $c_{0} \stackrel{\text { def }}{=} 0$
2. $c_{P \mid Q} \stackrel{\text { def }}{=} c_{P} \mid c_{Q}$
3. $c_{\alpha . P} \stackrel{\text { def }}{=}\langle!\alpha\rangle c_{P}$

Definition 4.10 (Characteristic formulas for contexts). If $\mathcal{M}$ is a finite context, we define its characteristic formula by:

$$
\begin{equation*}
c_{\mathcal{M}}=K_{0}\left(\bigvee_{Q \in \mathcal{M}} c_{Q}\right) \wedge\left(\bigwedge_{Q \in \mathcal{M}} \widetilde{K}_{0} c_{Q}\right) \tag{4.1}
\end{equation*}
$$

## Spatial axioms

Axiom E 1. $\vdash T \mid \perp \rightarrow \perp$
Axiom E 2. $\vdash \phi \mid 0 \leftrightarrow \phi$
Axiom E 3. $\vdash \phi|\psi \rightarrow \psi| \phi$
Axiom E 4. $\vdash(\phi \mid \psi)|\rho \rightarrow \phi|(\psi \mid \rho)$
Axiom E 5. $\vdash \phi \mid(\psi \vee \rho) \rightarrow(\phi \mid \psi) \vee(\phi \mid \rho)$
Axiom E 6. $\vdash\left(c_{P} \wedge \phi \mid \psi\right) \rightarrow \bigvee_{P \equiv Q \mid R}\left(c_{Q} \wedge \phi\right) \mid\left(c_{R} \wedge \psi\right)$

## Spatial rules

Rule $\mathbf{E}_{R}$ 1. If $\vdash \phi \rightarrow \psi$ then $\vdash \phi|\rho \rightarrow \psi| \rho$

Axiom E1 states the propagation of the inconsistency from a subsystem to the upper system.
Axioms E2, E3 and E4 depict the structure of abelian monoid projected by the parallel operator on the class of processes.

Concerning axiom E6, observe that the disjunction involved has a finite number of terms, as we considered the processes up to structural congruence level. The theorem states that if system has a property expressed by parallel composition of specifications, then it must have two parallel complementary subsystems, each of them satisfying one of the specifications.

Rule $\mathrm{E}_{R} 1$ states a monotony property for the parallel operator.

## Dynamic axioms

Axiom E 7. $\vdash\langle\alpha\rangle \phi \mid \psi \rightarrow\langle\alpha\rangle(\phi \mid \psi)$
Axiom E 8. $\vdash[\alpha](\phi \rightarrow \psi) \rightarrow([\alpha] \phi \rightarrow[a] \psi)$
Axiom E 9. $\vdash 0 \rightarrow[\alpha] \perp$
Axiom E 10. If $\beta \neq \alpha_{i}$ for $i=1$..n then $\vdash\left\langle!\alpha_{1}\right\rangle \top|\ldots|\left\langle!\alpha_{n}\right\rangle \top \rightarrow[\beta] \perp$
Axiom E 11. $\vdash\langle!\alpha\rangle \phi \rightarrow[\alpha] \phi$

## Dynamic rules

Rule $\mathbf{E}_{R}$ 2. If $\vdash \phi$ then $\vdash[\alpha] \phi$
Rule $\mathbf{E}_{R}$ 3. If $\vdash \phi \rightarrow[\alpha] \phi^{\prime}$ and $\vdash \psi \rightarrow[\alpha] \psi^{\prime}$ then $\vdash \phi \mid \psi \rightarrow[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$.
Rule $\mathbf{E}_{R}$ 4. If $\vdash \bigvee_{\mathcal{M} \in \mathfrak{M}_{\bullet \phi \emptyset}^{a c t(\phi)+}} c_{\mathcal{M}} \rightarrow \phi$ then $\vdash \phi$.
The first dynamic axiom, axiom E7, presents a domain extrusion property for the dynamic operator. It expresses the fact that if an active subsystem of a bigger system performs the action $\alpha$, then the bigger system performs it as a whole.

Axiom E8 is just the (K)-axiom for the dynamic operator.
Axiom E9 states that an inactive system cannot perform any action.
Given a complex process that can be exhaustively decomposed in $n$ parallel subprocesses, each of them being able to perform one action only, $\alpha_{i}$, for $i=1 . . n$, axiom E10 ensures us that the entire system, as a whole, cannot perform another action $\beta \neq \alpha_{i}$ for $i=1$..n.

Recalling that the operator $\langle!\alpha\rangle$ describes processes guarded by $\alpha$, axiom E11 states that a system described by a guarded process can perform one and only one action, the guarding one.

Rule $\mathrm{E}_{R} 2$ is the classic necessity rule used for the dynamic operator.
Rule $\mathrm{E}_{R} 3$ is, in a sense, a counterpart of axiom E7 establishing the action of the operator $[\alpha]$ in relation to the parallel operator.

Rule $\mathrm{E}_{R} 4$ comes as a consequence of the finite model property and provides a rule that characterizes, in a finite manner, the validity of a formula. Observe that the disjunction in the first part of the rule has a finite number of terms.

## Epistemic axioms

Axiom E 12. If $P \in \mathfrak{S}$ then $\vdash K_{P} \top \leftrightarrow c_{P} \mid \top$
Axiom E 13. $\vdash K_{Q} \phi \wedge K_{Q}(\phi \rightarrow \psi) \rightarrow K_{Q} \psi$
Axiom E 14. $\vdash K_{Q} \phi \rightarrow \phi$
Axiom E 15. $\vdash K_{Q} \phi \rightarrow K_{Q} K_{Q} \phi$.
Axiom E 16. $\vdash K_{Q} \top \rightarrow\left(\neg K_{Q} \phi \rightarrow K_{Q} \neg K_{Q} \phi\right)$
Axiom E 17. $\vdash K_{Q} \phi \leftrightarrow\left(K_{Q} \top \wedge K_{0}\left(K_{Q} \top \rightarrow \phi\right)\right)$
Axiom E 18. $\vdash K_{0} \phi \wedge \psi\left|\rho \rightarrow\left(K_{0} \phi \wedge \psi\right)\right|\left(K_{0} \phi \wedge \rho\right)$
Axiom E 19. $\vdash K_{0} \phi \rightarrow[\alpha] K_{0} \phi$
Axiom E 20. $\vdash K_{0} \phi \rightarrow\left(K_{Q} \top \rightarrow K_{Q} K_{0} \phi\right)$

## Epistemic rules

Rule $\mathbf{E}_{R}$ 5. If $\vdash \phi$ then $\vdash K_{Q} \top \rightarrow K_{Q} \phi$.
Rule $\mathbf{E}_{R}$ 6. If $\mathcal{M} \ni P$ is a finite context and $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow K_{0} \phi$ then $\vdash c_{\mathcal{M}} \rightarrow \phi$.

Axiom E12 states the equivalence between to be active and to know for the epistemic agents. Indeed $\mathcal{M}, Q \models K_{P} \top$ means exactly $P$ is an active subsystem of $Q$ and nothing more. The same can be expressed by $\mathcal{M}, Q=c_{P} \mid \top$.

Axiom E13 is the classical (K)-axiom stating that our epistemic operator is a normal one. This is an expected axiom as all the epistemic logics have it.

The same remark on axiom E14 which is just the axiom ( T ) - necessity axiom, for the epistemic operator.

Also axiom E15 is well known in epistemic logics. It states that our epistemic agents satisfy the positive introspection property, i.e. if $P$ knows something then it knows that it knows that thing.

Axiom E16 states a variant of the negative introspection, saying that if an agent $P$ is active and if it doesn't know $\phi$, then it knows that it doesn't know $\phi$. The novelty in our axiom is the precondition $K_{P} \top$ of the negative introspection. This precondition guarantees that the agent really exists, i.e. it is active. Such a precondition does not appear in the other epistemic logics for the reason that, in those cases, the agents exists always and they knows, always, at least the tautologies.

Axiom E17 provides a full description of the $K_{Q}$ operator by means of $K_{0}$ and $K_{Q} \top$. As, by axiom E12, $K_{Q} \top$ can be expressed by the epistemic operators, our system might be reduced to one epistemic operator only, $K_{0}$. We leave for future work the analysis of minimality for our axiomatic system. For the moment we consider it interesting to have all these epistemic operators that provide links with the rest of epistemic logics.

Axioms E18, E19 and E20 present $K_{0} \phi$ as a syntactic encryption of validity, stating that once $K_{0} \phi$ can be stated for a real system, it will be propagated to all the levels of it.

Rule $\mathrm{E}_{R} 5$ states that any active agent knows all the tautologies. As in the case of the negative introspection, we deal with a well known epistemic rule, widely spread in epistemic logics, but our rules work under the assumption that the agent is active.

Also rule $\mathrm{E}_{R} 6$ depicts the fact that $K_{0} \phi$ is an encoding of the validity in a given context.

### 4.5 The soundness of $\mathcal{L}_{D E S}^{\mathscr{S}}$ against the process semantics

In this section we will motivate the choice of the axioms by proving the soundness of our system with respect to process semantics. In this way we will prove that everything expressed by our axioms and rules about the process semantics is correct and, in conclusion, using our system, we can derive only theorems that can be meaningfully interpreted.

Theorem 4.6 (Process-Soundness). The system $\mathcal{L}_{D E S}^{\subseteq}$ is sound against the process semantics.

Proof. The soundness of $\mathcal{L}_{D E S}^{\mathfrak{S}}$ will be sustained by the soundness of all spatial, dynamic and epistemic axioms and rules.

## Soundness of the spatial axioms and rules

We start with proving the soundness of the spatial axioms and rules.

## Lemma 4.7 (Soundness of axiom E1). $\vDash \top \mid \perp \rightarrow \perp$

Proof. Suppose that it exists a context $\mathcal{M}$ and a process $P \in \mathcal{M}$ such that $\mathcal{M}, P \models \top \mid \perp$. Then $P \equiv Q \mid R$ with $\mathcal{M}, Q \models \top$ and $\mathcal{M}, R \vDash \perp$; i.e. $\mathcal{M}, R \not \vDash \top$. But this is not possible. Hence, there is no context $\mathcal{M}$ and process $P \in \mathcal{M}$ such that $\mathcal{M}, P \models \top \mid \perp$, i.e. for any context $\mathcal{M}$ and any process $P \in \mathcal{M}$ we have $\mathcal{M}, P \models \neg(\top \mid \perp)$, i.e. $\mathcal{M}, P \models \top \mid \perp \rightarrow \perp$.

Lemma 4.8 (Soundness of axiom E2). $\models \phi \mid 0 \leftrightarrow \phi$.
Proof. $\mathcal{M}, P \models \phi \mid 0$ iff $P \equiv Q \mid R, \mathcal{M}, Q \models \phi$ and $\mathcal{M}, R \models 0$. Then $R \equiv 0$, so $P \equiv Q$, hence $\mathcal{M}, P \models \phi$.
If $\mathcal{M}, P \models \phi$, because $\mathcal{M}, 0 \models 0$ and $P \equiv P \mid 0 \in \mathcal{M}$ we obtain that $\mathcal{M}, P \models \phi \mid 0$.
Lemma 4.9 (Soundness of axiom E3). $\vDash \phi|\psi \rightarrow \psi| \phi$.
Proof. $\mathcal{M}, P \models \phi \mid \psi$ means that $P \equiv Q \mid R, \mathcal{M}, Q \models \phi$ and $\mathcal{M}, R \models \psi$. But $P \equiv R \mid Q \in \mathcal{M}$, hence $\mathcal{M}, P \models \psi \mid \phi$.

Lemma 4.10 (Soundness of axiom E4). $\vDash(\phi \mid \psi)|\rho \rightarrow \phi|(\psi \mid \rho)$.
Proof. $\mathcal{M}, P \models(\phi \mid \psi) \mid \rho$ implies that $P \equiv Q|R, \mathcal{M}, Q \models \phi| \psi$ and $\mathcal{M}, R \models \rho$. Then $Q \equiv S \mid V$ with $\mathcal{M}, S \models \phi$ and $\mathcal{M}, V \models \psi$. But $P \equiv(S \mid V)|R \equiv S|(V \mid R)$, where $\mathcal{M}, S \models \phi$ and $\mathcal{M}, V \mid R \models$ $\psi \mid \rho$. Hence $\mathcal{M}, P \models \phi \mid(\psi \mid \rho)$.

Lemma 4.11 (Soundness of axiom E5). $\models \phi \mid(\psi \vee \rho) \rightarrow(\phi \mid \psi) \vee(\phi \mid \rho)$
Proof. $\mathcal{M}, P \models \phi \mid(\psi \vee \rho)$ means that $P \equiv Q \mid R, \mathcal{M}, P \models \phi$ and $\mathcal{M}, R \models \psi \vee \rho$, i.e. $\mathcal{M}, R \models \psi$ or $\mathcal{M}, R \models \rho$. Hence $\mathcal{M}, P \models \phi \mid \psi$ or $\mathcal{M}, P \models \phi \mid \rho$. So $\mathcal{M}, P \models(\phi \mid \psi) \vee(\phi \mid \rho)$.

On this point we have enough information to prove two expected results: first that $c_{P}$ is, indeed, satisfied by the process $P$ and second, that the formula $c_{P}$ is satisfied by the whole $\equiv$-equivalence class of $P$. These results will be useful in proving the rest of the soundness lemmas.

Theorem 4.12. If $P \in \mathcal{M}$, then $\mathcal{M}, P \models c_{P}$.
Proof. We prove it by induction on the structure of the process $P$.
The case $P \equiv 0: \mathcal{M}, 0 \models c_{0}$, because $0 \in \mathcal{M}, c_{0}=0$ and $\mathcal{M}, 0 \models 0$.
The case $P \equiv Q \mid R$ : we have $Q, R \in \mathcal{M}$ and $c_{P}=c_{Q} \mid c_{R}$. By the inductive hypothesis $\mathcal{M}, Q \models c_{Q}$ and $\mathcal{M}, R \models c_{R}$, so $\mathcal{M}, Q|R|=c_{Q} \mid c_{R}$. Hence $\mathcal{M}, P \models c_{P}$.
The case $P \equiv \alpha . Q$ : we have $P \xrightarrow{\alpha} Q$, hence $Q \in \mathcal{M}$. Moreover, $c_{P}=\langle\alpha\rangle c_{Q} \wedge 1$. By the inductive hypothesis $\mathcal{M}, Q \vDash c_{Q}$. Because $P \xrightarrow{\alpha} Q$, we obtain $\mathcal{M}, P \vDash\langle\alpha\rangle c_{Q}$, and because $P \equiv \alpha \cdot Q$ is a guarded process, we have also $\mathcal{M}, P \models 1$. Hence $\mathcal{M}, P \models c_{P}$.

Theorem 4.13. $\mathcal{M}, P \models c_{Q}$ iff $P \equiv Q$.
Proof. $(\Leftarrow)$ We prove it by verifying that $\mathcal{M}, P \models c_{Q}$ for any $P, Q$ involved in the equivalence rules.

- if $P=R \mid S$ and $Q=S \mid R$, we have $\mathcal{M}, R\left|S \models c_{R}\right| c_{S}$ and using the soundness of axiom E3, we obtain $\mathcal{M}, R\left|S \models c_{S}\right| c_{R}$, i.e. $\mathcal{M}, P \models c_{Q}$
- if $P=(R \mid S) \mid U$ and $Q=R \mid(S \mid U)$ we have $\mathcal{M}, P \models\left(c_{R} \mid c_{S}\right) \mid c_{U}$. Using the soundness of axiom E4, we obtain $\mathcal{M}, P \models c_{Q}$. Similarly $\mathcal{M}, Q \models c_{P}$, using the soundness of axioms E3 and E4.
- if $P=Q \mid 0$ then $\mathcal{M}, P \models c_{Q} \mid 0$, i.e., by using the soundness of axiom $\mathrm{E} 2, \mathcal{M}, P \models c_{Q}$. Similarly reverse, form $\mathcal{M}, Q \models c_{Q}$ we derive, by using the soundness of axiom E2, $\mathcal{M}, Q \models c_{Q} \mid 0$, i.e. $\mathcal{M}, Q \models c_{P}$.
- if $P=P^{\prime} \mid R$ and $Q=Q^{\prime} \mid R$ with $P^{\prime} \equiv Q^{\prime}$ and $\mathcal{M}, P^{\prime} \models c_{Q^{\prime}}$, because $\mathcal{M}, R \models c_{R}$, we obtain that $\mathcal{M}, P \models c_{Q^{\prime}} \mid c_{R}$, i.e. $\mathcal{M}, P \models c_{Q}$.
- if $P=\alpha . P^{\prime}$ and $Q=\alpha . Q^{\prime}$ with $P^{\prime} \equiv Q^{\prime}$ and $\mathcal{M}, P^{\prime} \models c_{Q^{\prime}}$, as $P \xrightarrow{\alpha} P^{\prime}$, then $\mathcal{M}, P \models$ $\langle\alpha\rangle c_{Q^{\prime}}$. But $\mathcal{M}, P \mid=1$, because $P$ is a guarded process, hence $\mathcal{M}, P \models\langle\alpha\rangle c_{Q^{\prime}} \wedge 1$, i.e. $\mathcal{M}, P \models c_{Q}$.
$(\Rightarrow)$ We prove the implication in this sense by induction on the structure of $Q$.
- if $Q \equiv 0$, then $\mathcal{M}, P \models c_{0}$, means $\mathcal{M}, P \models 0$. Hence $P \equiv 0$.
- if $Q \equiv R \mid S$ then $\mathcal{M}, P \models c_{Q}$ is equivalent with $\mathcal{M}, P \models c_{R} \mid c_{S}$. So $P \equiv U \mid V, \mathcal{M}, U \models c_{R}$ and $\mathcal{M}, V \models c_{S}$. By the inductive hypothesis we obtain that $U \equiv R$ and $V \equiv S$. Hence $P \equiv Q$.
- if $Q \equiv \alpha . R$, then $\mathcal{M}, P \models c_{Q}$ is equivalent with $\mathcal{M}, P \models\langle\alpha\rangle c_{R} \wedge 1$. So $P \xrightarrow{\alpha} P^{\prime}$ with $\mathcal{M}, P^{\prime} \models c_{R}$. By the inductive hypothesis, $P^{\prime} \equiv R$. And because $\mathcal{M}, P \models 1$ we obtain that $P \equiv \alpha . R$, i.e. $P \equiv Q$.

Lemma 4.14 (Soundness of axiom E6). $\vDash\left(c_{P} \wedge \phi \mid \psi\right) \rightarrow \bigvee_{P \equiv Q \mid R}\left(c_{Q} \wedge \phi\right) \mid\left(c_{R} \wedge \psi\right)$
Proof. Suppose that $\mathcal{M}, S \models c_{P} \wedge \phi \mid \psi$. Then $S \equiv P$ (by theorem 4.13) and $S \equiv S_{1} \mid S_{2}$ with $\mathcal{M}, S_{1}=\phi$ and $\mathcal{M}, S_{2}=\psi$.
But $\mathcal{M}, S_{1} \models c_{S_{1}}$ and $\mathcal{M}, S_{2} \models c_{S_{2}}$, by theorem 4.12.
Hence $\mathcal{M}, S_{1} \models \phi \wedge c_{S_{1}}$ and $\mathcal{M}, S_{2} \models \psi \wedge c_{S_{2}}$.
And because $P \equiv S \equiv S_{1} \mid S_{2}$, we obtain $\mathcal{M}, P \models\left(\phi \wedge c_{S_{1}}\right) \mid\left(\psi \wedge c_{S_{2}}\right)$, hence $\mathcal{M}, P \models \bigvee_{P \equiv Q \mid R}\left(c_{Q} \wedge\right.$ $\phi) \mid\left(c_{R} \wedge \psi\right)$, q.e.d.

Lemma 4.15 (Soundness of rule $\mathbf{E}_{R} \mathbf{1}$ ). If $\models \phi \rightarrow \psi$ then $\models \phi|\rho \rightarrow \psi| \rho$
Proof. If $\mathcal{M}, P \models \phi \mid \rho$ then $P \equiv Q \mid R, \mathcal{M}, Q \models \phi$ and $\mathcal{M}, R \models \rho$. But from the hypothesis, $\mathcal{M}, Q \models \phi \rightarrow \psi$, hence $\mathcal{M}, Q \models \psi$. Then $\mathcal{M}, P \models \psi \mid \rho$, so $\models \phi|\rho \rightarrow \psi| \rho$.

## Soundness of the dynamic axioms and rules

We prove now the soundness for the class of dynamic axioms and rules.

Lemma 4.16 (Soundness of axiom E7). $\models\langle\alpha\rangle \phi \mid \psi \rightarrow\langle\alpha\rangle(\phi \mid \psi)$.
Proof. If $\mathcal{M}, P \vDash\langle\alpha\rangle \phi \mid \psi$, then $P \equiv R \mid S, \mathcal{M}, R \models\langle\alpha\rangle \phi$ and $\mathcal{M}, S \models \psi$. So $\exists R \xrightarrow{\alpha} R^{\prime}$ and $\mathcal{M}, R^{\prime} \models \phi$. So $\exists P \equiv R\left|S \xrightarrow{\alpha} P^{\prime} \equiv R^{\prime}\right| S$ and $\mathcal{M}, P^{\prime} \models \phi \mid \psi$. Hence $\mathcal{M}, P \models\langle\alpha\rangle(\phi \mid \psi)$.

Lemma 4.17 (Soundness of axiom E8). $\vDash[\alpha](\phi \rightarrow \psi) \rightarrow([\alpha] \phi \rightarrow[\alpha] \psi)$
Proof. Let $\mathcal{M}, P \models[\alpha](\phi \rightarrow \psi)$ and $\mathcal{M}, P \models[\alpha] \phi$. If there is no $P^{\prime}$ such that $P \xrightarrow{\alpha} P^{\prime}$, then $\mathcal{M}, P \models[\alpha] \psi$. Suppose that exists such $P^{\prime}$. Then for any such $P^{\prime}$ we have $\mathcal{M}, P^{\prime} \models \phi \rightarrow \psi$ and $\mathcal{M}, P^{\prime} \models \phi$. Hence $\mathcal{M}, P^{\prime} \models \psi$, i.e. $\mathcal{M}, P \models[\alpha] \psi$.

Lemma 4.18 (Soundness of axiom E9). $\vDash 0 \rightarrow[\alpha] \perp$
Proof. If $\mathcal{M}, P \models 0$ then $P \equiv 0$ and there is no transition $0 \xrightarrow{\alpha} P^{\prime}$, hence $\mathcal{M}, P \not \vDash\langle\alpha\rangle \top$, i.e. $\mathcal{M}, P \models[\alpha] \perp$.

Lemma 4.19 (Soundness of axiom E10).

$$
\text { If } \beta \neq \alpha_{i} \text { for } i=1 . . n \text {, then } \models\left\langle!\alpha_{1}\right\rangle \top|\ldots|\left\langle!\alpha_{n}\right\rangle \top \rightarrow[\beta] \perp
$$

Proof. Suppose that $\mathcal{M}, P \models\left\langle!\alpha_{1}\right\rangle \top|\ldots|\left\langle!\alpha_{n}\right\rangle \top$. Then necessarily $P \equiv \alpha_{1} . P_{1}|\ldots| \alpha_{n} . P_{n}$. But if $\alpha_{i} \neq \beta$ for $i=1 . . n$, there is no transition

$$
\alpha_{1} \cdot P_{1}|\ldots| \alpha_{n} \cdot P_{n} \xrightarrow{\beta} P^{\prime}
$$

hence $\mathcal{M}, P \not \models\langle\beta\rangle \top$, i.e. $\mathcal{M}, P \models[\beta] \perp$.
Lemma 4.20 (Soundness of axiom E11). $\models\langle!\alpha\rangle \phi \rightarrow[\alpha] \phi$
Proof. Suppose that $\mathcal{M}, P \models\langle!\alpha\rangle \phi$, then $\mathcal{M}, P \models 1$ and $\mathcal{M}, P \models\langle\alpha\rangle \phi$. Then necessarily $P \equiv \alpha . P^{\prime}$ and $\mathcal{M}, P^{\prime} \vDash \phi$. But there is only one reduction that $P$ can do, $P \xrightarrow{\alpha} P^{\prime}$. So, for any reduction $P \xrightarrow{\alpha} P^{\prime \prime}$ (because there is only one), we have $\mathcal{M}, P^{\prime \prime} \models \phi$, i.e. $\mathcal{M}, P \models[\alpha] \phi$

Lemma 4.21 (Soundness of rule $\mathbf{E}_{R} \mathbf{2}$ ). If $\models \phi$ then $\models[\alpha] \phi$.
Proof. Let $\mathcal{M}$ be a context and $P \in \mathcal{M}$ a process. If there is no $P^{\prime}$ such that $P \xrightarrow{\alpha} P^{\prime}$, then $\mathcal{M}, P \models[\alpha] \phi$. Suppose that exists such $P^{\prime}$ (obviously $\left.P^{\prime} \in \mathcal{M}\right)$. Then for any such $P^{\prime}$ we have $\mathcal{M}, P^{\prime} \models \phi$, due to the hypothesis $\models \phi$. Hence $\mathcal{M}, P \models[\alpha] \phi$.

Lemma 4.22 (Soundness of rule $\mathrm{E}_{R} 3$ ).

$$
\text { If } \models \phi \rightarrow[\alpha] \phi^{\prime} \text { and } \models \psi \rightarrow[\alpha] \psi^{\prime} \text { then } \models \phi \mid \psi \rightarrow[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)
$$

Proof. Suppose that $\mathcal{M}, P \models \phi \mid \psi$, then $P \equiv Q \mid R, \mathcal{M}, Q \models \phi$ and $\mathcal{M}, R \models \psi$. Because $\vDash \phi \rightarrow[\alpha] \phi^{\prime}$ and $\models \psi \rightarrow[\alpha] \psi^{\prime}$, we derive $\mathcal{M}, Q \models[\alpha] \phi^{\prime}$ and $\mathcal{M}, R \models[\alpha] \psi^{\prime}$. We analyze some cases:

- if $P$ cannot perform a transition by $\alpha$, then $\mathcal{M}, P \models[\alpha] \perp$, and using the soundness of axiom E8 and rule $\mathrm{E}_{R} 2$ we derive

$$
\models[\alpha] \perp \rightarrow[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)
$$

hence, we obtain in the end $\mathcal{M}, P \models[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$.

- if $Q \xrightarrow{\alpha} Q^{\prime}$ and $R$ cannot perform a transition by $\alpha$, then $Q\left|R \xrightarrow{\alpha} Q^{\prime}\right| R$ and the transitions of $P \equiv Q \mid R$ by $\alpha$ have always this form.
But $\mathcal{M}, Q \models[\alpha] \phi^{\prime}$, so for any such $Q^{\prime}$ we have $\mathcal{M}, Q^{\prime} \models \phi^{\prime}$, thus $\mathcal{M}, Q^{\prime}\left|R \models \phi^{\prime}\right| \psi$, i.e. $\mathcal{M}, Q^{\prime} \mid R \vDash\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$.
Hence for any transition $P \xrightarrow{\alpha} P^{\prime}$ we have $\mathcal{M}, P^{\prime} \models\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$. In conclusion, $\mathcal{M}, P \models$ $[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$.
- if $Q$ cannot perform a transition by $\alpha$ and $R \xrightarrow{\alpha} R^{\prime}$, similarly as in the previous case, we can derive $\mathcal{M}, P \models[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$.
- if $Q \xrightarrow{\alpha} Q^{\prime}$ and $R \xrightarrow{\alpha} R^{\prime}$ then $P \xrightarrow{\alpha} P^{\prime}$ has either the form $Q\left|R \xrightarrow{\alpha} Q^{\prime}\right| R$ or $Q \mid R \xrightarrow{\alpha}$ $Q \mid R^{\prime}$. But $\mathcal{M}, Q^{\prime}\left|R=\phi^{\prime}\right| \psi$, hence $\mathcal{M}, Q^{\prime} \mid R \models\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$ and $\mathcal{M}, Q\left|R^{\prime} \models \phi\right| \psi^{\prime}$, hence $\mathcal{M}, Q \mid R^{\prime} \models\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$. Thus, for any transition $P \xrightarrow{\alpha} P^{\prime}$ we have $\mathcal{M}, P^{\prime} \models\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$, i.e. $\mathcal{M}, P \models[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$.

So, in any case $\mathcal{M}, P \models[\alpha]\left(\phi^{\prime}|\psi \vee \phi| \psi^{\prime}\right)$, that concludes the proof.
Lemma 4.23 (Soundness of rule $\mathbf{E}_{R} 4$ ). If $\models \bigvee_{\mathcal{M} \in \mathfrak{M}_{\Delta \phi\rangle}^{a c t(\phi)+}} c_{\mathcal{M}} \rightarrow \phi$ then $\models \phi$.

Proof. Suppose that $\models \bigvee_{\mathcal{M} \in \mathfrak{M}_{(\phi \phi}^{a c t(\phi)}+} c_{\mathcal{M}} \rightarrow \phi$ but it exists a model $\mathcal{N}$ and a process $Q \in \mathcal{N}$ with $\mathcal{N}, Q \not \models \phi$. Then $\mathcal{N}, Q \models \neg \phi$.
Further, using the finite model property, theorem 4.4, we obtain that it exists a context $\mathcal{N}^{\prime} \in$ $\mathfrak{M}_{(\phi \emptyset}^{a c t(\phi)_{+}}$and a process $R \in \mathcal{N}^{\prime}$ with $\mathcal{N}^{\prime}, R \models \neg \phi$.
But $(\phi)=(\neg \phi)$, and $\operatorname{act}(\phi)=\operatorname{act}(\neg \phi)$ so it exists a context $\mathcal{N}^{\prime} \in \mathfrak{M}_{(\phi \emptyset)}^{a c t(\phi)_{+}}$and a process $R \in \mathcal{N}^{\prime}$ with $\mathcal{N}^{\prime}, R \models \neg \phi$. Because $\mathcal{N}^{\prime}, R \models c_{\mathcal{N}^{\prime}}$, we derive $\mathcal{N}^{\prime}, R \models \bigvee_{\mathcal{M} \in \mathfrak{M}^{a+\phi}}^{a c t(\phi)+} c_{\mathcal{M}}$.
But $\models \bigvee_{\mathcal{M} \in \mathfrak{M}_{\emptyset \phi \phi}^{a c t(\phi)+}} c_{\mathcal{M}} \rightarrow \phi$ implies $\mathcal{N}^{\prime}, R \models \bigvee_{\mathcal{M} \in \mathfrak{M}_{i \phi D}^{a c t(\phi)+}} c_{\mathcal{M}} \rightarrow \phi$, hence $\mathcal{N}^{\prime}, R \models \phi$.
As we also have $\mathcal{N}^{\prime}, R \models \neg \phi$, we obtain $\mathcal{N}^{\prime}, R \models \perp$ - impossible!
Then, for any model $\mathcal{N}$ and any process $P \in \mathcal{N}$ we have $\mathcal{N}, P \models \phi$, i.e. $\models \phi$.

## Soundness of the epistemic axioms and rules

Hereafter we prove the soundness for the epistemic axioms and rules.
Lemma 4.24 (Soundness of axiom E12). If $Q \in \mathfrak{S}$ then $\models c_{Q} \mid \top \leftrightarrow K_{Q}{ }^{\top}$
Proof. If $\mathcal{M}, P \models c_{Q} \mid \top$ then $P \equiv R \mid S$, with $\mathcal{M}, S \models c_{Q}$. Then theorem 4.36 gives $S \equiv Q$, hence $P \equiv Q \mid R$. And because for any $Q \mid R^{\prime} \in \mathcal{M}$ we have $\mathcal{M}, Q \mid R^{\prime} \models \top$, we derive $\mathcal{M}, P \models K_{Q} \top$.
Suppose now the reverse, i.e. that $\mathcal{M}, P \models K_{Q} \top$. Then $P \equiv Q \mid R$. But $\mathcal{M}, P \models c_{P}$, hence $\mathcal{M}, P \models c_{Q} \mid c_{R}$.
Because $\vDash c_{Q} \rightarrow \top$, using the soundness of rule $\mathrm{E}_{R} 1$, we derive $\models c_{Q}\left|c_{R} \rightarrow c_{Q}\right| \top$ from where we conclude that $\mathcal{M}, P \models c_{Q} \mid \top$.

Lemma 4.25 (Soundness of axiom E13). $\models K_{Q} \phi \wedge K_{Q}(\phi \rightarrow \psi) \rightarrow K_{Q} \psi$
Proof. Suppose that $\mathcal{M}, P \models K_{Q} \phi$ and that $\mathcal{M}, P \models K_{Q}(\phi \rightarrow \psi)$. Then $P \equiv Q \mid R$ and for any $S$ such that $S \mid Q \in \mathcal{M}$ we have $\mathcal{M}, S \mid Q \models \phi$ and $\mathcal{M}, Q \mid S \models \phi \rightarrow \psi$. Hence for any such $Q \mid S$ we have $\mathcal{M}, Q \mid S \models \psi$ and because $P \equiv Q \mid R$ we obtain that $\mathcal{M}, P \models K_{Q} \psi$.

Lemma 4.26 (Soundness of axiom E14). $\vDash K_{Q} \phi \rightarrow \phi$.
Proof. If $\mathcal{M}, P \models K_{Q} \phi$ then $P \equiv Q \mid R$ and for any $Q \mid S \in \mathcal{M}$ we have $\mathcal{M}, Q \mid S \models \phi$, i.e. $\mathcal{M}, Q \mid R \models \phi$, so $\mathcal{M}, P \models \phi$.

Lemma 4.27 (Soundness of axiom E15). $\vDash K_{Q} \phi \rightarrow K_{Q} K_{Q} \phi$.
Proof. Suppose that $\mathcal{M}, P \models K_{Q} \phi$, then $P \equiv Q \mid R$ and for any $Q \mid S \in \mathcal{M}$ we have $\mathcal{M}, Q \mid S \models \phi$. Let $Q \mid S^{\prime} \in \mathcal{M}$ be arbitrarily chosen. As for any $Q \mid S \in \mathcal{M}$ we have $\mathcal{M}, Q \mid S \models \phi$, we derive that $\mathcal{M}, Q \mid S^{\prime} \models K_{Q} \phi$. But $Q \mid S^{\prime}$ has been arbitrarily chosen, so for any $Q \mid S \in \mathcal{M}$ we have $\mathcal{M}, Q \mid S \models K_{Q} \phi$, and because $P \equiv Q \mid R$ we obtain $\mathcal{M}, P \models K_{Q} K_{Q} \phi$.

Lemma 4.28 (Soundness of axiom E16). $\vDash K_{Q} \top \rightarrow\left(\neg K_{Q} \phi \rightarrow K_{Q} \neg K_{Q} \phi\right)$
Proof. Suppose that $\mathcal{M}, P \vDash K_{Q} \top$ and $\mathcal{M}, P \vDash \neg K_{Q} \phi$. Then $P \equiv Q \mid R$ and $\exists S$ such that $\mathcal{M}, S \mid Q \models \neg \phi$. But then for any $U$ such that $U \mid Q \in \mathcal{M}$ we have $\mathcal{M}, U \mid Q \models \neg K_{Q} \phi$. Hence $\mathcal{M}, P \models K_{Q} \neg K_{Q} \phi$.

Lemma 4.29 (Soundness of axiom E17). $\models K_{Q} \phi \leftrightarrow\left(K_{Q} \top \wedge K_{0}\left(K_{Q} \top \rightarrow \phi\right)\right)$
Proof. Suppose that $\mathcal{M}, P \models K_{Q} \phi$. Then $P \equiv Q \mid R$ and for any $Q \mid S \in \mathcal{M}$ we have $\mathcal{M}, Q \mid S \models \phi$. From $P \equiv Q \mid R$, because for any $Q \mid S \in \mathcal{M}$ we have $\mathcal{M}, Q \mid S \models \top$, we derive $\mathcal{M}, P \models K_{Q} \top$.

Consider now an arbitrary process $S \in \mathcal{M}$. If $\mathcal{M}, S \not \vDash K_{Q}{ }^{\top}$, then $\mathcal{M}, S \models K_{Q}{ }^{\top} \rightarrow \phi$.
If $\mathcal{M}, S \models K_{Q} \top$ we derive that $S \equiv Q \mid S^{\prime}$, hence $\mathcal{M}, S \models \phi$.
So, for an arbitrarily chosen $S \in \mathcal{M}$ we have $\mathcal{M}, S \models K_{Q} \top \rightarrow \phi$.
Because $P \equiv P \mid 0$ and for any process $S \equiv S \mid 0 \in \mathcal{M}$ we have
$\mathcal{M}, S \models K_{Q} \top \rightarrow \phi$, we derive that $\mathcal{M}, P \models K_{0}\left(K_{Q} \top \rightarrow \phi\right)$. Hence $\models K_{Q} \phi \rightarrow\left(K_{Q} \top \wedge\right.$ $\left.K_{0}\left(K_{Q} \top \rightarrow \phi\right)\right)$.

Suppose now that $\mathcal{M}, P \vDash K_{Q} \top \wedge K_{0}\left(K_{Q} \top \rightarrow \phi\right)$. From $\mathcal{M}, P \models K_{Q} \top$ we derive $P \equiv Q \mid R$. Because $\mathcal{M}, P \vDash K_{0}\left(K_{Q} \top \rightarrow \phi\right)$, we obtain that for any process $S \in \mathcal{M}$ we have $\mathcal{M}, S \models$ $K_{Q} \top \rightarrow \phi$. Hence, for any process $S \mid Q \in \mathcal{M}$ we have $\mathcal{M}, S \mid Q \models \phi$ (because $\mathcal{M}, S \mid Q \models K_{Q} \top$ ). And because $P \equiv Q \mid R$, we derive $\mathcal{M}, P \mid=K_{Q} \phi$.

Lemma 4.30 (Soundness of axiom E18). $\vDash K_{0} \phi \wedge \psi\left|\rho \rightarrow\left(K_{0} \phi \wedge \psi\right)\right|\left(K_{0} \phi \wedge \rho\right)$
Proof. Suppose that $\mathcal{M}, P \models K_{0} \phi \wedge \psi \mid \rho$ then $\mathcal{M}, P \models K_{0} \phi$ and $\mathcal{M}, P \models \psi \mid \rho$.
$\mathcal{M}, P \models K_{0} \phi$ gives that for any $R \in \mathcal{M}$ we have $\mathcal{M}, R \models \phi$.
$\mathcal{M}, P \models \psi \mid \rho$ gives that $P \equiv P^{\prime} \mid P^{\prime \prime}$ and $\mathcal{M}, P^{\prime} \models \psi, \mathcal{M}, P^{\prime \prime} \models \rho$. Because $P^{\prime}, P^{\prime \prime} \in \mathcal{M}$ and because for any $R \in \mathcal{M}, \mathcal{M}, R \models \phi$ we derive that $\mathcal{M}, P^{\prime} \models K_{0} \phi$ and $\mathcal{M}, P^{\prime \prime} \models K_{0} \phi$.
Hence $\mathcal{M}, P^{\prime} \models \psi \wedge K_{0} \phi$ and $\mathcal{M}, P^{\prime \prime} \models \rho \wedge K_{0} \phi$. As $P \equiv P^{\prime} \mid P^{\prime \prime}$, we obtain further $\mathcal{M}, P \models$ $\left(K_{0} \phi \wedge \psi\right) \mid\left(K_{0} \phi \wedge \rho\right)$.

Lemma 4.31 (Soundness of axiom E19). $\models K_{0} \phi \rightarrow[\alpha] K_{0} \phi$
Proof. Suppose that $\mathcal{M}, P \models K_{0} \phi$, then for any $R \in \mathcal{M}$ we have $\mathcal{M}, R=\phi$.
If $P$ cannot perform a transition by $\alpha$, we have $\mathcal{M}, P \models[\alpha] K_{0} \phi$.
If $P$ can perform such transitions, then for any $P \xrightarrow{\alpha} P^{\prime}$ we have
$\mathcal{M}, P^{\prime} \models K_{0} \phi$ (as for any $R \in \mathcal{M}$ we have $\mathcal{M}, R \models \phi$ ). This means $\mathcal{M}, P \models[\alpha] K_{0} \phi$.
Lemma 4.32 (Soundness of axiom E20). $\models K_{0} \phi \rightarrow\left(K_{Q} \top \rightarrow K_{Q} K_{0} \phi\right)$
Proof. Suppose that $\mathcal{M}, P \models K_{0} \phi$ and $\mathcal{M}, P \models K_{Q} \top$.
$\mathcal{M}, P \models K_{0} \phi$ gives that for any $R \in \mathcal{M}$ we have $\mathcal{M}, R \models \phi$.
$\mathcal{M}, P \vDash K_{Q} \top$ means that $P \equiv Q \mid S$. Because for any $R \in \mathcal{M}$ we have $\mathcal{M}, R \neq \phi$, we obtain that for any $Q \mid S^{\prime} \in \mathcal{M}$ we have $\mathcal{M}, Q\left|S^{\prime}\right|=K_{0} \phi$, and because $P \equiv Q \mid S$ we obtain $\mathcal{M}, P \models K_{Q} K_{0} \phi$.

Lemma 4.33 (Soundness of rule $\mathbf{E}_{R} 5$ ). If $\models \phi$ then $\models K_{Q} \top \rightarrow K_{Q} \phi$
Proof. If $\models \phi$ then for any context $\mathcal{M}$ and any process $P \in \mathcal{M}$ we have $\mathcal{M}, P \models \phi$. Suppose now that $\mathcal{M}, P \models K_{Q} \top$. Then $P \equiv Q \mid R$. Because $\mathcal{M}, S \models \phi$ for each $S \in \mathcal{M}$, we derive that for any $S \mid Q \in \mathcal{M}$ we have $\mathcal{M}, S \mid Q \models \phi$. Hence $\mathcal{M}, P \models K_{Q} \phi$.

Lemma 4.34 (Soundness of rule $\mathrm{E}_{R} 6$ ).

$$
\text { If } \mathcal{M} \ni P \text { is a finite context and } \models c_{\mathcal{M}} \wedge c_{P} \rightarrow K_{0} \phi \text { then } \models c_{M} \rightarrow \phi
$$

Proof. Suppose that $\vDash c_{\mathcal{M}} \wedge c_{P} \rightarrow K_{0} \phi$ and $\mathcal{N}$ is an arbitrary context with $Q \in \mathcal{N}$. If $\mathcal{N}, Q \not \vDash c_{\mathcal{M}}$ then $\mathcal{N}, Q \vDash c_{\mathcal{M}} \rightarrow \phi$.
If $\mathcal{N}, Q \models c_{\mathcal{M}}$, then $\mathcal{N}=\mathcal{M}$. Further $\mathcal{M}, P \models c_{P} \wedge c_{\mathcal{M}}$ gives $\mathcal{M}, P \models K_{0} \phi$, i.e. for each $S \mid 0 \equiv S \in \mathcal{M}$ we have $\mathcal{M}, S \models \phi$. Now, because $\mathcal{N}=\mathcal{M}$ and $Q \in \mathcal{M}$ we obtain $\mathcal{N}, Q \models \phi$. Hence, also in this case $\mathcal{N}, Q \models c_{M} \rightarrow \phi$. Thus $\models c_{\mathcal{M}} \rightarrow \phi$.

Hence we have a sound system and all the theorems that can be proved with it are sound results with respect to process semantics.

### 4.6 Characteristic formulas

In this subsection we use the peculiarities of the dynamic and epistemic operators to prove that the characteristic formulas for processes and for finite contexts introduced before can identify the processes and the finite contexts respectively.

We begin by restating some relevant results, proved before, in order to offer to the reader a full picture of the problem.

Theorem 4.35. $\mathcal{M}, P \models c_{P}$.
Proof. It has been proved as theorem 4.12.
Theorem 4.36. $\mathcal{M}, P \models c_{Q}$ iff $P \equiv Q$.
Proof. It has been proved as theorem 4.13.
The next theorems show that $c_{P}$ could provide a syntactic characterization of the process $P$, stating that the conjunction of two such formulas, $c_{P}$ and $c_{Q}$, is inconsistent if the indexes are not structurally congruent, and respectively that two structurally congruent indexes generate logical equivalent formulas.

Theorem 4.37. If $P \not \equiv Q$ then $\vdash c_{P} \rightarrow \neg c_{Q}$.
Proof. We prove it by induction on $P$.

- the case $P \equiv 0$ : as $P \not \equiv Q$ we obtain that $Q \equiv \alpha . R \mid S$. So $c_{Q}=\langle\alpha\rangle c_{R} \wedge 1 \mid c_{S}$ that implies, using theorem 4.47, $\vdash c_{Q} \rightarrow\langle\alpha\rangle c_{R} \mid c_{S}$, and applying axiom E7, $\vdash c_{Q} \rightarrow\langle\alpha\rangle\left(c_{R} \mid c_{S}\right)$.
But $\vdash c_{R} \mid c_{S} \rightarrow \top$ and applying theorem 4.50, we obtain $\vdash\langle\alpha\rangle\left(c_{R} \mid c_{S}\right) \rightarrow\langle\alpha\rangle \top$.
Hence, $\vdash c_{Q} \rightarrow\langle\alpha\rangle \top$. Then $\vdash \neg\langle\alpha\rangle \top \rightarrow \neg c_{Q}$.
Axiom E9 gives $\vdash 0 \rightarrow \neg\langle\alpha\rangle \top$ hence, in the end, $\vdash 0 \rightarrow \neg c_{Q}$, i.e. $\vdash c_{P} \rightarrow \neg c_{Q}$.
- the case $P \equiv P^{\prime} \mid P^{\prime \prime}$ : we have $c_{P}=c_{P^{\prime}} \mid c_{P^{\prime \prime}}$. Because $P \not \equiv Q$, we obtain that for any decomposition $Q \equiv Q^{\prime} \mid Q^{\prime \prime}$ we have either $P^{\prime} \not \equiv Q^{\prime}$ or $P^{\prime \prime} \not \equiv Q^{\prime \prime}$. Using the inductive hypothesis, we derive that either $\vdash c_{Q^{\prime}} \rightarrow \neg c_{P^{\prime}}$ or $\vdash c_{Q^{\prime \prime}} \rightarrow \neg c_{P^{\prime \prime}}$. Because this is happening for any decomposition of $Q$, we can apply theorem 4.49 and we obtain $\vdash c_{Q} \rightarrow \neg\left(c_{P^{\prime}} \mid c_{P^{\prime \prime}}\right)$, i.e. $\vdash c_{Q} \rightarrow \neg c_{P}$. Hence $\vdash c_{P} \rightarrow \neg c_{Q}$.
- the case $P \equiv \alpha . P^{\prime}: c_{P}=1 \wedge\langle\alpha\rangle c_{P^{\prime}}$, so $\vdash c_{P} \rightarrow 1 \wedge\langle\alpha\rangle \top$. But axiom E10 gives $\vdash\langle\alpha\rangle \top \wedge 1 \rightarrow \neg\langle\beta\rangle \top$ for any $\beta \neq \alpha$. Hence, for any $\beta \neq \alpha$ we have $\vdash c_{P} \rightarrow \neg\langle\beta\rangle \top$.
- if $Q \equiv 0$ we already proved that $\vdash c_{Q} \rightarrow \neg c_{P}$ (because $P \not \equiv 0$ ), so $\vdash c_{P} \rightarrow \neg c_{Q}$
- if $Q \equiv \beta . Q^{\prime} \mid Q^{\prime \prime}$ for some $\beta \neq \alpha$, then $\vdash c_{Q} \rightarrow\langle\beta\rangle \top$, hence $\vdash \neg\langle\beta\rangle \top \rightarrow \neg c_{Q}$. But we proved that $\vdash c_{P} \rightarrow \neg\langle\beta\rangle \top$. Hence $\vdash c_{P} \rightarrow \neg c_{Q}$.
- if $Q \equiv \alpha \cdot Q_{1}|\ldots| \alpha \cdot Q_{k}$ for $k>1$, then $\vdash c_{Q} \rightarrow \neg 0 \mid \neg 0\left(\right.$ as $\vdash 0 \rightarrow \neg c_{\alpha \cdot Q_{1}}$ and $\vdash 0 \rightarrow$ $\neg c_{\alpha . Q_{2}|\ldots| \alpha . Q_{k}}$ ). Then $\vdash c_{Q} \rightarrow \neg 1$, i.e.
$\vdash 1 \rightarrow \neg c_{Q}$. But $\vdash c_{P} \rightarrow 1$. Hence $\vdash c_{P} \rightarrow \neg c_{Q}$.
- if $Q \equiv \alpha Q^{\prime}$ : then $P \not \equiv Q$ gives $P^{\prime} \not \equiv Q^{\prime}$. For this case we can use the inductive hypothesis and we obtain $\vdash c_{Q^{\prime}} \rightarrow \neg c_{P^{\prime}}$. Further, applying theorem 4.51, we obtain $\vdash[\alpha] c_{P^{\prime}} \rightarrow[\alpha] \neg c_{Q}^{\prime}$, i.e.
$\vdash[\alpha] c_{P^{\prime}} \rightarrow \neg\langle\alpha\rangle c_{Q^{\prime}}$ that gives, because $c_{Q}=1 \wedge\langle\alpha\rangle c_{Q^{\prime}}$,
$\vdash[\alpha] c_{P^{\prime}} \rightarrow \neg c_{Q}$.
Now, using axiom E11, $\vdash 1 \wedge\langle\alpha\rangle c_{P^{\prime}} \rightarrow[\alpha] c_{P^{\prime}}$, so $\vdash c_{P} \rightarrow[\alpha] c_{P^{\prime}}$, and, combining it with the previous result, we derive $\vdash c_{P} \rightarrow \neg c_{Q}$.

Theorem 4.38. If $P \equiv Q$ then $\vdash c_{P} \leftrightarrow c_{Q}$.
Proof. We prove it verifying the congruence rules:

- if $P=R \mid S$ and $Q=S \mid R$ then $\vdash c_{R}\left|c_{S} \leftrightarrow c_{S}\right| c_{R}$ from theorem 4.44, i.e. $\vdash c_{P} \leftrightarrow c_{Q}$
- if $P=(R \mid S) \mid U$ and $Q=R \mid(S \mid U)$ then theorem 4.45 we have
$\vdash\left(c_{R} \mid c_{S}\right)\left|c_{U} \leftrightarrow c_{R}\right|\left(c_{S} \mid c_{U}\right)$, i.e. $\vdash c_{P} \leftrightarrow c_{Q}$
- if $P=Q \mid 0$ then axiom E2 gives $\vdash c_{Q} \mid 0 \leftrightarrow c_{Q}$, i.e. $\vdash c_{P} \leftrightarrow c_{Q}$.
- if $P=P^{\prime} \mid R$ and $Q=Q^{\prime} \mid R$ with $P^{\prime} \equiv Q^{\prime}$ and $\vdash c_{P^{\prime}} \leftrightarrow c_{Q^{\prime}}$ then rule $\mathrm{E}_{R} 1$ gives $\vdash c_{P^{\prime}} \mid c_{R} \leftrightarrow$ $c_{Q^{\prime}} \mid c_{R}$. Hence $\vdash c_{P} \leftrightarrow c_{Q}$.
- if $P=\alpha . P^{\prime}$ and $Q=\alpha . Q^{\prime}$ with $P^{\prime} \equiv Q^{\prime}$ and $\vdash c_{P^{\prime}} \leftrightarrow c_{Q^{\prime}}$ then theorem 4.50 gives $\vdash\langle\alpha\rangle c_{P^{\prime}} \leftrightarrow\langle\alpha\rangle c_{Q^{\prime}}$, so $\vdash\left(\langle\alpha\rangle c_{P^{\prime}} \wedge 1\right) \leftrightarrow\left(\langle\alpha\rangle c_{Q^{\prime}} \wedge 1\right)$. Hence $\vdash c_{P} \leftrightarrow c_{Q}$.

We prove now that the intuition behind the definition of characteristic formulas for contexts is correct and, indeed, $c_{\mathcal{M}}$ can be used to characterize $\mathcal{M}$.

Theorem 4.39. If $\mathcal{M}$ is a finite context and $P \in \mathcal{M}$ then $\mathcal{M}, P \models c_{\mathcal{M}}$.
Proof. Obviously $\mathcal{M}, P \models c_{P}$, hence $\mathcal{M}, P \models \bigvee_{Q \in \mathcal{M}} c_{Q}$.
Similarly, for any $R \in \mathcal{M}$ we have $\mathcal{M}, R \equiv \bigvee_{Q \in \mathcal{M}} c_{Q}$, and because $R \equiv R \mid 0$ and $P \equiv P \mid 0$, we derive $\mathcal{M}, P \models K_{0}\left(\bigvee_{Q \in \mathcal{M}} c_{Q}\right)$.
As for any $R \in \mathcal{M}$ there exists a process $U \in \mathcal{M}$ (more exactly $U=R$ ) such that $\mathcal{M}, U \models c_{R}$, we obtain that for each $R \in \mathcal{M}$ we have
$\mathcal{M}, P \models \widetilde{K}_{0} c_{R}$, hence $\mathcal{M}, P \models \bigwedge_{Q \in \mathcal{M}} \tilde{K}_{0} c_{Q}$.
Corollary 4.40. If $\mathcal{M}$ is a finite context and $P \in \mathcal{M}$ then

$$
\mathcal{M}, P \models c_{\mathcal{M}} \wedge c_{P}
$$

Theorem 4.41. If $\mathcal{M}, P \models c_{\mathcal{N}}$ then $\mathcal{N}=\mathcal{M}$.
Proof. Suppose that $\mathcal{M}, P \models c_{\mathcal{N}}$, then $\mathcal{M}, P \models K_{0}\left(\bigvee_{Q \in \mathcal{N}} c_{Q}\right)$, i.e. for any $R \in \mathcal{M}$ we have $\mathcal{M}, R \models \bigvee_{Q \in \mathcal{N}} c_{Q}$. Hence, for any $R \in \mathcal{M}$ there exists a process $Q \in \mathcal{N}$ with $\mathcal{M}, R \models c_{Q}$, or equivalently, $R \equiv Q$.
Now $\mathcal{M}, P \models \bigwedge_{Q \in \mathcal{N}} K_{0} c_{Q}$ gives that for any $Q \in \mathcal{N}$ we have
$\mathcal{M}, P \models \tilde{K}_{0} c_{Q}$, i.e. there exists a process $R \in \mathcal{M}$ such that $\mathcal{M}, R \models c_{Q}$, or equivalently, $R \equiv Q$.
Hence, we proved that for any $R \in \mathcal{M}$ there exists $Q \in \mathcal{N}$ such that $R \equiv Q$, and for any $Q \in \mathcal{N}$ there exists $R \in \mathcal{M}$ such that $R \equiv Q$. Because we identify processes up to structural congruence, we decide that $M=N$.

### 4.7 Theorems of $\mathcal{L}_{D E S}^{\tilde{S}_{D E}}$

In this section we will derive some theorems for $\mathcal{L}_{D E S}^{\mathscr{S}}$. As, by soundness, the theorems specify "facts" about processes, we will try to interpret the nontrivial ones.

## Spatial results

We start with the results that can be proved on the basis of the spatial theorems and rules only. They reflect the behavior of the parallel operator in relation to the operators of the classical logic.

## Theorem 4.42. $\vdash \top \mid \top \leftrightarrow \top$

Proof. Obviously $\vdash \mathrm{T} \mid \top \rightarrow \top$. As $\vdash 0 \rightarrow \top$, using rule $\mathrm{E}_{R} 1$, we obtain $\vdash \top|0 \rightarrow \top| \top$. Further axiom E2 gives us $\vdash T \rightarrow T \mid T$.

Theorem 4.43. If $\vdash \phi$ then $\vdash \theta|\rho \rightarrow \phi| \rho$
Proof. Because $\vdash \phi$ implies $\vdash \theta \rightarrow \phi$, using rule $\mathrm{E}_{R} 1$ we obtain the result.
Theorem 4.44. $\vdash \phi|\psi \leftrightarrow \psi| \phi$
Proof. We use axiom E3 in both directions.
Theorem 4.45. $\vdash(\phi \mid \psi)|\rho \leftrightarrow \phi|(\psi \mid \rho)$
Proof. We use axiom E4 and theorem 4.44.
Theorem 4.46. $\vdash \phi \mid(\psi \vee \rho) \leftrightarrow(\phi \mid \psi) \vee(\phi \mid \rho)$
Proof. $\vdash \psi \rightarrow \psi \vee \rho$ so, using rule $\mathrm{E}_{R} 1, \vdash \phi|\psi \rightarrow \phi|(\psi \vee \rho)$. Similarly, $\vdash \phi|\rho \rightarrow \phi|(\psi \vee \rho)$. Hence $\vdash(\phi \mid \psi) \vee(\phi \mid \rho) \rightarrow \phi \mid(\psi \vee \rho)$. The other direction is stated by axiom E5.

Theorem 4.47. $\vdash \phi \mid(\psi \wedge \rho) \rightarrow(\phi \mid \psi) \wedge(\phi \mid \rho)$
Proof. Because $\vdash \psi \wedge \rho \rightarrow \psi$, by applying rule $\mathrm{E}_{R} 1$, we have $\vdash \phi|(\psi \wedge \rho) \rightarrow \phi| \psi$. Similarly $\vdash \phi|(\psi \wedge \rho) \rightarrow \phi| \rho$.

The next result proves a strong version of monotonicity of the parallel composition.

Theorem 4.48. If $\vdash \phi \rightarrow \rho$ and $\vdash \psi \rightarrow \theta$ then $\vdash \phi|\psi \rightarrow \rho| \theta$.
Proof. If $\vdash \phi \rightarrow \rho$ then rule $\mathrm{E}_{R} 1$ gives us $\vdash \phi|\psi \rightarrow \rho| \psi$. If $\vdash \psi \rightarrow \theta$, then the same rule gives $\vdash \rho|\psi \rightarrow \rho| \theta$. Hence $\vdash \phi|\psi \rightarrow \rho| \theta$.

The next result speaks about the negative parallel decomposition of a specification. It states that, given two specifications, $\phi$ and $\psi$, if considering any parallel decomposition of our system (process) $P \equiv Q \mid R$, we obtain that either $Q$ doesn't satisfy $\phi$ or $R$ doesn't satisfy $\psi$, then our system $P$ does not satisfy the parallel composition of the two specifications, $\phi \mid \psi$.

Theorem 4.49. If for any decomposition $P \equiv Q \mid R$ we have $\vdash c_{Q} \rightarrow \neg \phi$ or $\vdash c_{R} \rightarrow \neg \psi$ then $\vdash c_{P} \rightarrow \neg(\phi \mid \psi)$.

Proof. $\vdash c_{Q} \rightarrow \neg \phi$ is equivalent with $\vdash c_{Q} \wedge \phi \rightarrow \perp$ and because $\vdash c_{R} \wedge \psi \rightarrow \top$, we obtain, by theorem $4.48 \vdash\left(c_{Q} \wedge \phi\right)\left|\left(c_{R} \wedge \psi\right) \rightarrow \perp\right| \top$. And using axiom E1, we derive

$$
\vdash\left(c_{Q} \wedge \phi\right) \mid\left(c_{R} \wedge \psi\right) \rightarrow \perp
$$

Similarly, from $\vdash c_{R} \rightarrow \neg \psi$ we can derive

$$
\vdash\left(c_{Q} \wedge \phi\right) \mid\left(c_{R} \wedge \psi\right) \rightarrow \perp
$$

Hence, the hypothesis of the theorem says that for any decomposition $P \equiv Q \mid R$ we have $\vdash\left(c_{Q} \wedge \phi\right) \mid\left(c_{R} \wedge \psi\right) \rightarrow \perp$, i.e.

$$
\vdash \bigvee_{P \equiv Q \mid R}\left(c_{Q} \wedge \phi\right) \mid\left(c_{R} \wedge \psi\right) \rightarrow \perp
$$

But axiom E6 gives

$$
\vdash\left(c_{P} \wedge \phi \mid \psi\right) \rightarrow \bigvee_{P \equiv Q \mid R}\left(c_{Q} \wedge \phi\right) \mid\left(c_{R} \wedge \psi\right)
$$

hence

$$
\vdash\left(c_{P} \wedge \phi \mid \psi\right) \rightarrow \perp \text {, i.e. } \vdash c_{P} \rightarrow \neg(\phi \mid \psi) .
$$

Remark 4.2. Related to the same topic of the relation between negation and the parallel operator, observe that the negation is not distributive with respect to parallel. This is the reason why, in the previous theorem, we had to ask in the premises that the condition $\vdash c_{Q} \rightarrow \neg \phi$ or $\vdash c_{R} \rightarrow \neg \psi$ be fulfilled by all the possible decompositions of $P$. If only a decomposition $P \equiv Q \mid R$ exists such that $\vdash c_{Q} \rightarrow \neg \phi$ or $\vdash c_{R} \rightarrow \neg \psi$, this is not enough to derive $\mathcal{M}, P \models \neg(\phi \mid \psi)$. Indeed suppose that $\mathcal{M}, Q \models \phi$ but $\mathcal{M}, Q \not \vDash \psi$ and $\mathcal{M}, R \models \psi$ but $\mathcal{M}, R \not \models \phi$. Then from $\mathcal{M}, Q \models \phi$ and $\mathcal{M}, R \models \psi$ we derive $\mathcal{M}, P \models \phi \mid \psi$. It is not the case that, from the additional information $\mathcal{M}, Q \not \vDash \psi$ and $\mathcal{M}, R \not \models \phi, \mathcal{M}, P \models \neg(\phi \mid \psi)$ to be derived. All we can derive from the unused information is that $\mathcal{M}, P \models \neg \phi \mid \neg \psi$, which does not contradict $\mathcal{M}, P \models \phi \mid \psi$.

### 4.8 Dynamic results

Now we focus of the theorems that derive from the class of dynamic axioms and rules. Remark the modal behaviors of the dynamic operators.

The next result states the monotonicity of the diamond operator.
Theorem 4.50 (Monotonicity). If $\vdash \phi \rightarrow \psi$ then $\vdash\langle\alpha\rangle \phi \rightarrow\langle\alpha\rangle \psi$.
Proof. $\vdash \phi \rightarrow \psi$ implies $\vdash \neg \psi \rightarrow \neg \phi$. Using rule $\mathrm{E}_{R} 2$ we obtain $\vdash[\alpha](\neg \psi \rightarrow \neg \phi)$ and axiom E8 gives $\vdash[\alpha] \neg \psi \rightarrow[\alpha] \neg \phi$. This is equivalent with $\vdash \neg\langle\alpha\rangle \psi \rightarrow$ $\neg\langle\alpha\rangle \phi$, i.e. $\vdash\langle\alpha\rangle \phi \rightarrow\langle\alpha\rangle \psi$.

Theorem 4.51. If $\vdash \phi \rightarrow \psi$ then $\vdash[\alpha] \neg \psi \rightarrow[\alpha] \neg \phi$.
Proof. If $\vdash \phi \rightarrow \psi$ then, by theorem $4.50, \vdash\langle\alpha\rangle \phi \rightarrow\langle\alpha\rangle \psi$, hence $\vdash \neg\langle\alpha\rangle \psi \rightarrow \neg\langle\alpha\rangle \phi$, that gives $\vdash[\alpha] \neg \psi \rightarrow[\alpha] \neg \phi$.

The next theorems confirm the intuition that the formulas $c_{P}$, in their interrelations, mimic the transitions of the processes (the dynamic operators mimic the transition labeled by the action it has as index).

Theorem 4.52. If $P$ cannot do any transition by $\alpha$ then $\vdash c_{P} \rightarrow[\alpha] \perp$.

Proof. We prove it by induction on the structure of $P$.
The case $P \equiv 0$ : axiom E9 implies $\vdash 0 \rightarrow[\alpha] \perp$ which proves this case, because $c_{0}=0$.
The case $P \equiv \alpha_{1} . P_{1}|\ldots| \alpha_{n} . P_{n}$ : as $P$ cannot perform $\alpha$ we have $\alpha \neq \alpha_{i}$ for $i=1$..n. We have $c_{P}=\left(\left\langle\alpha_{1}\right\rangle c_{P_{1}} \wedge 1\right)|\ldots|\left(\left\langle\alpha_{n}\right\rangle c_{P_{n}} \wedge 1\right)$. From $\vdash c_{P_{i}} \rightarrow \top$ we derive, using theorem 4.50, $\vdash\left(\left\langle\alpha_{i}\right\rangle c_{P_{i}} \wedge\right.$ $1) \rightarrow\left(\left\langle\alpha_{i}\right\rangle \top \wedge 1\right)$. Further, we apply theorem 4.48 and obtain $\vdash c_{P} \rightarrow\left(\left\langle\alpha_{1}\right\rangle \top \wedge 1\right)|\ldots|\left(\left\langle\alpha_{n}\right\rangle \top \wedge 1\right)$. Axiom E10 gives that for $\alpha \neq \alpha_{i}, \vdash\left(\left\langle\alpha_{1}\right\rangle \top \wedge 1\right)|\ldots|\left(\left\langle\alpha_{n}\right\rangle \top \wedge 1\right) \rightarrow[\alpha] \perp$. Hence $\vdash c_{P} \rightarrow[\alpha] \perp$.

Theorem 4.53. $\vdash c_{P} \rightarrow[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}$
Proof. We prove it by induction on $P$.
The case $P \not \equiv \alpha . P^{\prime} \mid P^{\prime \prime}$ for some $P^{\prime}, P^{\prime \prime}$ : then $P$ cannot preform a transition by $\alpha$, hence, by theorem $4.52, \vdash c_{P} \rightarrow[\alpha] \perp$. But
$\vdash \neg \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \top$, and using theorem 4.51, we derive

$$
\vdash[\alpha] \perp \rightarrow[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}
$$

Combining this with $\vdash c_{P} \rightarrow[\alpha] \perp$, we derive

$$
\vdash c_{P} \rightarrow[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}
$$

The case $P \equiv \alpha . P^{\prime}$ : then $\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}=\left\{c_{P^{\prime}}\right\}$ and $c_{P}=\langle\alpha\rangle c_{P^{\prime}} \wedge 1$. Applying axiom E11 we obtain $\vdash c_{P} \rightarrow[\alpha] c_{P^{\prime}}$. Hence

$$
\vdash c_{P} \rightarrow[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}
$$

The case $P \equiv \alpha \cdot P^{\prime} \mid P^{\prime \prime}$ with $P^{\prime \prime} \not \equiv 0$ : we apply the inductive hypothesis to $\alpha \cdot P^{\prime}$ and $P^{\prime \prime}$ respectively, and we obtain

$$
\vdash c_{\alpha . P^{\prime}} \rightarrow[\alpha] \bigvee\left\{c_{Q^{\prime}} \mid \alpha . P^{\prime} \xrightarrow{\alpha} Q^{\prime}\right\}
$$

and

$$
\vdash c_{P^{\prime \prime}} \rightarrow[\alpha] \bigvee\left\{c_{Q^{\prime \prime}} \mid P^{\prime \prime} \xrightarrow{\alpha} Q^{\prime \prime}\right\}
$$

We apply rule $\mathrm{E}_{R} 3$ and obtain

$$
\vdash c_{P} \rightarrow[\alpha]\left(c_{\alpha . P^{\prime}}\left|\bigvee\left\{c_{Q^{\prime \prime}} \mid P^{\prime \prime} \xrightarrow{\alpha} Q^{\prime \prime}\right\} \vee \bigvee\left\{c_{Q^{\prime}} \mid \alpha . P^{\prime} \xrightarrow{\alpha} Q^{\prime}\right\}\right| c_{P^{\prime \prime}}\right)
$$

Using theorem 4.46, we obtain this result equivalent with

$$
\vdash c_{P} \rightarrow[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}
$$

Theorem 4.54. If $\vdash \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \phi$ then $\vdash c_{P} \rightarrow[\alpha] \phi$
Proof. If $\vdash \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \phi$ then rule $\mathrm{E}_{R} 2$ gives

$$
\vdash[\alpha]\left(\bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \phi\right)
$$

and further axiom E8 gives $\vdash[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow[\alpha] \phi$. But theorem 4.53 gives $\vdash c_{P} \rightarrow$ $[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}$, hence $\vdash c_{P} \rightarrow[\alpha] \phi$.

## Epistemic results

We begin by stating that 0 is always an active agent: it always performs its "inactivity" expressed by 0 .

Theorem 4.55. $\vdash K_{0} \top$.
Proof. Trivial consequence of axiom E12 and axiom E2.
The next result states that an agent knows something only if it is active. Hence to know implies to be.

Theorem 4.56. $\vdash K_{P} \phi \rightarrow K_{P} \top$.
Proof. Trivial consequence of axiom E17.
Further we prove another obvious property of knowledge: if $Q$ knows $\phi$ and $Q$ knows $\psi$, this is equivalent with $Q$ knows $\phi \wedge \psi$.

Theorem 4.57. $\vdash K_{Q} \phi \wedge K_{Q} \psi \leftrightarrow K_{Q}(\phi \wedge \psi)$
Proof. $\vdash \phi \rightarrow(\psi \rightarrow(\phi \wedge \psi))$. Using rule $\mathrm{E}_{R} 5$, we obtain

$$
\vdash K_{Q} \top \rightarrow K_{Q}[\phi \rightarrow(\psi \rightarrow(\phi \wedge \psi))]
$$

We apply axiom E13 twice, and obtain

$$
\vdash K_{Q} \top \rightarrow\left[K_{Q} \phi \rightarrow\left(K_{Q} \psi \rightarrow K_{Q}(\phi \wedge \psi)\right)\right]
$$

i.e.

$$
\vdash K_{Q} \top \wedge K_{Q} \phi \rightarrow\left[K_{Q} \psi \rightarrow K_{Q}(\phi \wedge \psi)\right]
$$

But $\vdash K_{Q} \phi \rightarrow K_{Q} \top$, hence $\vdash K_{Q} \phi \rightarrow\left[K_{Q} \psi \rightarrow K_{Q}(\phi \wedge \psi)\right]$, i.e.

$$
\vdash K_{Q} \phi \wedge K_{Q} \psi \rightarrow K_{Q}(\phi \wedge \psi)
$$

Reverse, we apply rule $\mathrm{E}_{R} 5$ to $\vdash \phi \wedge \psi \rightarrow \psi$ and then axiom E13, and obtain $\vdash K_{Q} \top \rightarrow$ $\left(K_{Q}(\phi \wedge \psi) \rightarrow K_{Q} \phi\right)$. But $\vdash K_{Q}(\phi \wedge \psi) \rightarrow K_{Q} \top$, hence $\vdash K_{Q}(\phi \wedge \psi) \rightarrow K_{Q} \phi$.
Similarly $\vdash K_{Q}(\phi \wedge \psi) \rightarrow K_{Q} \psi$.
The knowledge is redundant and introspective: if $Q$ knows $\phi$ this is equivalent with the fact that $Q$ knows that $Q$ knows $\phi$.

Theorem 4.58. $\vdash K_{Q} K_{Q} \phi \leftrightarrow K_{Q} \phi$.
Proof. Axiom E15 gives $\vdash K_{Q} \phi \rightarrow K_{Q} K_{Q} \phi$, and axiom E14 gives $\vdash K_{Q} K_{Q} \phi \rightarrow K_{Q} \phi$.

## Theorem 4.59 (Monotonicity of knowledge).

$$
\text { If } \vdash \phi \rightarrow \psi \text { then } \vdash K_{P} \phi \rightarrow K_{P} \psi
$$

Proof. Because $\vdash \phi \rightarrow \psi$, we can use rule $\mathrm{E}_{R} 5$ and obtain
$\vdash K_{P} \top \rightarrow K_{P}(\phi \rightarrow \psi)$. But theorem 4.56 gives $\vdash K_{P} \phi \rightarrow K_{P} \top$, hence $\vdash K_{P} \phi \rightarrow K_{P}(\phi \rightarrow \psi)$ where from we derive

$$
\vdash K_{P} \phi \rightarrow\left(K_{P} \phi \wedge K_{P}(\phi \rightarrow \psi)\right)
$$

This entails, using axiom E13, $\vdash K_{P} \phi \rightarrow K_{P} \psi$.

The existence of an agent entails the existence of its active sub-agents, as proved further. This is a knowledge-like description of the ontological topology of agents. It relies on to be is to know.

Theorem 4.60. $\vdash K_{P \mid Q} \top \rightarrow K_{P} \top$.
Proof. Axiom E12 gives $\vdash K_{P \mid Q} \top \leftrightarrow c_{P}\left|c_{Q}\right| \top$ and $\vdash K_{P} \top \leftrightarrow c_{P} \mid \top$. But $\vdash c_{Q} \rightarrow \top$ and applying rule $\mathrm{E}_{R} 1$, we obtain $\vdash c_{P}\left|c_{Q}\right| \top \rightarrow c_{P} \mid \top$. Hence $\vdash K_{P \mid Q} \top \rightarrow K_{P} \top$.

The knowledge of an agent is consistent: if it knows $\neg \phi$ (it knows that $\phi$ is false) then it cannot know $\phi$ as well. This is proved in the next two theorems.

Theorem 4.61. $\vdash K_{Q} \neg \phi \rightarrow \neg K_{Q} \phi$.
Proof. Axiom E14 gives $\vdash K_{Q} \neg \phi \rightarrow \neg \phi$ and $\vdash K_{Q} \phi \rightarrow \phi$. The last is equivalent with $\vdash \neg \phi \rightarrow$ $\neg K_{Q} \phi$, and combined with the first entails $\vdash K_{Q} \neg \phi \rightarrow \neg K_{Q} \phi$.

Theorem 4.62 (Consistency theorem). $\vdash K_{Q} \phi \rightarrow \neg K_{Q} \neg \phi$.
Proof. By using the negative form of theorem 4.61
In the next four theorems we will focus on the knowledge of the agent 0 . It represents "the most ignorant" agent in $\mathcal{M}$ in the sense that if it knows something then everybody else knows it as well. This property might be exploited in the sense that what 0 knows is a validity in $\mathcal{M}$. And the dual of knowledge operator applied to 0 gives the satisfiability in $\mathcal{M}$.

Theorem 4.63. $\vdash K_{0} \phi \rightarrow\left(K_{Q} \top \rightarrow K_{Q} \phi\right)$
Proof. Axioms E14 gives $\vdash K_{0} \phi \rightarrow \phi$ and applying the monotonicity of knowledge, $\vdash K_{Q} K_{0} \phi \rightarrow$ $K_{Q} \phi$.
Now axiom E20 provides $\vdash K_{0} \phi \wedge K_{Q} \top \rightarrow K_{Q} K_{0} \phi$. Thus $\vdash K_{0} \phi \wedge K_{Q} \top \rightarrow K_{Q} \phi$, that is equivalent with $\vdash K_{0} \phi \rightarrow\left(K_{Q} \top \rightarrow K_{Q} \phi\right)$.

Theorem 4.64. $\vdash \widetilde{K}_{0} \phi \leftrightarrow K_{0} \tilde{K}_{0} \phi$
Proof. By definition, we have $\vdash \tilde{K}_{0} \phi \leftrightarrow \neg K_{0} \neg \phi$, and because $\vdash K_{0} \top$, we derive $\vdash \widetilde{K}_{0} \phi \rightarrow$ $\left(\neg K_{0} \neg \phi \wedge K_{0} \top\right)$.
But axiom E16 entails $\vdash\left(\neg K_{0} \neg \phi \wedge K_{0} \top\right) \rightarrow K_{0} \neg K_{0} \neg \phi$, i.e.

$$
\vdash\left(\neg K_{0} \neg \phi \wedge K_{0} \top\right) \rightarrow K_{0} \tilde{K}_{0} \phi
$$

Hence $\vdash \widetilde{K}_{0} \phi \rightarrow K_{0} \tilde{K}_{0} \phi$.
We have also $\vdash K_{0} \tilde{K}_{0} \phi \rightarrow \widetilde{K}_{0} \phi$, by applying axiom E14.
Theorem 4.65. $\vdash \tilde{K}_{0} \phi \wedge \psi\left|\rho \rightarrow\left(\tilde{K}_{0} \phi \wedge \psi\right)\right|\left(\tilde{K}_{0} \phi \wedge \rho\right)$
Proof. Axiom E18 instantiated with $\phi=\tilde{K}_{0} \phi$ gives

$$
\vdash K_{0} \tilde{K}_{0} \phi \wedge \psi\left|\rho \rightarrow\left(K_{0} \tilde{K}_{0} \phi \wedge \psi\right)\right|\left(K_{0} \tilde{K}_{0} \phi \wedge \rho\right)
$$

Further, using theorem 4.64, we obtain the wanted result.
Theorem 4.66. $\vdash \tilde{K}_{0} \phi \rightarrow[\alpha] \tilde{K}_{0} \phi$

Proof. Axiom E19 instantiated with $\phi=\tilde{K}_{0} \phi$ gives

$$
\vdash K_{0} \widetilde{K}_{0} \phi \rightarrow[\alpha] K_{0} \widetilde{K}_{0} \phi
$$

Further, using theorem 4.64, we obtain the wanted result.
Theorem 4.67. $\vdash \tilde{K}_{0} \phi \rightarrow\left(K_{Q} \top \rightarrow K_{Q} \tilde{K}_{0} \phi\right)$
Proof. Axiom E20 instantiated with $\phi=\widetilde{K}_{0} \phi$ gives

$$
\vdash K_{0} \tilde{K}_{0} \phi \rightarrow\left(K_{Q} \top \rightarrow K_{Q} K_{0} \tilde{K}_{0} \phi\right)
$$

Further, using theorem 4.64, we obtain the wanted result.

## Theorems referring to contexts

In this section we focus on results that involve the characteristic formulas of finite contexts. We try to show, in this way, how sensitive our system is with respect to contexts. Further, these results will be used in proving the completeness for $\mathcal{L}_{D E S}^{\mathfrak{G}}$.

Theorem 4.68. If $\mathcal{M}$ is a finite context and $R \notin \mathcal{M}$ then $\vdash c_{\mathcal{M}} \rightarrow \neg c_{R}$.
Proof. Because $c_{\mathcal{M}}=K_{0}\left(\bigvee_{P \in \mathcal{M}} c_{P}\right) \wedge\left(\bigwedge_{P \in \mathcal{M}} \widetilde{K}_{0} c_{P}\right)$ we derive that

$$
\vdash c_{\mathcal{M}} \rightarrow K_{0}\left(\bigvee_{P \in \mathcal{M}} c_{P}\right)
$$

But from axiom E14 $\vdash K_{0}\left(\bigvee_{P \in \mathcal{M}} c_{P}\right) \rightarrow \bigvee_{P \in \mathcal{M}} c_{P}$, so $\vdash c_{\mathcal{M}} \rightarrow \bigvee_{P \in \mathcal{M}} c_{P}$. Further theorem 4.37 gives $\vdash c_{P} \rightarrow \neg c_{R}($ as $R \notin \mathcal{M}$ and $P \in \mathcal{M}$ implies $R \not \equiv P)$ which implies $\vdash \bigvee_{P \in \mathcal{M}} c_{P} \rightarrow$ $\neg c_{R}$. But we proved that $\vdash c_{\mathcal{M}} \rightarrow \bigvee_{P \in \mathcal{M}} c_{P}$. Hence $\vdash c_{\mathcal{M}} \rightarrow \neg c_{R}$.

Theorem 4.69. If $\mathcal{M}$ is a finite context then

$$
\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right) \rightarrow\left(c_{\mathcal{M}} \wedge \phi\right) \mid\left(c_{\mathcal{M}} \wedge \psi\right)
$$

Proof. Observe that, by applying axiom E18, we obtain

$$
\begin{equation*}
\vdash\left(K_{0} \theta_{1} \wedge \tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3}\right) \wedge \phi\left|\psi \rightarrow\left(\tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3}\right) \wedge\left(K_{0} \theta_{1} \wedge \phi\right)\right|\left(K_{0} \theta_{1} \wedge \psi\right) \tag{4.2}
\end{equation*}
$$

If, further, we apply theorem 4.65 once, we obtain

$$
\begin{aligned}
& \vdash\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2}\right) \wedge\left(K_{0} \theta_{1} \wedge \phi\right) \mid\left(K_{0} \theta_{1} \wedge \psi\right) \rightarrow \\
& \tilde{K}_{0} \theta_{3} \wedge\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \phi\right) \mid\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \psi\right)
\end{aligned}
$$

Hence

$$
\vdash\left(K_{0} \theta_{1} \wedge \tilde{K}_{0} \theta_{2} \wedge \widetilde{K}_{0} \theta_{3}\right) \wedge \phi\left|\psi \rightarrow \widetilde{K}_{0} \theta_{3} \wedge\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \phi\right)\right|\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \psi\right)
$$

If we apply again theorem 4.65 we obtain

$$
\begin{aligned}
& \vdash \tilde{K}_{0} \theta_{3} \wedge\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \phi\right) \mid\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \psi\right) \rightarrow \\
& \left(\tilde{\tilde{K}}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \phi\right) \mid\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \psi\right)
\end{aligned}
$$

hence

$$
\begin{aligned}
& \stackrel{\vdash}{ }\left(K_{0} \theta_{1} \wedge \tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3}\right) \wedge \phi \mid \psi \rightarrow \\
&\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \phi\right) \mid\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1} \wedge \psi\right)
\end{aligned}
$$

Because $c_{\mathcal{M}}=K_{0}\left(\bigvee_{Q \in \mathcal{M}} c_{Q}\right) \wedge\left(\bigwedge_{Q \in \mathcal{M}} \widetilde{K}_{0} c_{Q}\right)$, we can use the same idea, applying theorem 4.65 once for each process in $\mathcal{M}$ (being finite) and we obtain

$$
\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right) \rightarrow\left(c_{\mathcal{M}} \wedge \phi\right) \mid\left(c_{\mathcal{M}} \wedge \psi\right)
$$

Theorem 4.70. If $\mathcal{M}$ is a finite context then $\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right) \rightarrow\left(c_{\mathcal{M}} \wedge \phi\right) \mid \psi$
Proof. From the previous theorem, 4.69, we have

$$
\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right) \rightarrow\left(c_{\mathcal{M}} \wedge \phi\right) \mid\left(c_{\mathcal{M}} \wedge \psi\right)
$$

Theorem 4.47 gives

$$
\left.\left(c_{\mathcal{M}} \wedge \phi\right) \mid\left(c_{\mathcal{M}} \wedge \psi\right) \rightarrow\left(\left(c_{\mathcal{M}} \wedge \phi\right) \mid c_{\mathcal{M}}\right) \wedge\left(\left(c_{\mathcal{M}} \wedge \phi\right) \mid \psi\right)\right)
$$

Hence $\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right) \rightarrow\left(c_{\mathcal{M}} \wedge \phi\right) \mid \psi$.
Theorem 4.71. If $\mathcal{M}$ is a finite context then $\vdash c_{\mathcal{M}} \rightarrow[\alpha] c_{\mathcal{M}}$
Proof. Observe that, by applying axiom E19, we obtain

$$
\vdash K_{0} \theta_{1} \wedge \tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3} \rightarrow\left(\tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3}\right) \wedge[\alpha] K_{0} \theta_{1}
$$

If, further, we apply theorem 4.66 once, we obtain

$$
\begin{aligned}
& \vdash\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2}\right) \wedge[\alpha] K_{0} \theta_{1} \rightarrow \tilde{K}_{0} \theta_{3} \wedge[\alpha] \tilde{K}_{0} \theta_{2} \wedge[\alpha] K_{0} \theta_{1}, \text { i.e. } \\
& \qquad\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2}\right) \wedge[\alpha] K_{0} \theta_{1} \rightarrow \widetilde{K}_{0} \theta_{3} \wedge[\alpha]\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)
\end{aligned}
$$

Hence

$$
\vdash\left(K_{0} \theta_{1} \wedge \widetilde{K}_{0} \theta_{2} \wedge \widetilde{K}_{0} \theta_{3}\right) \rightarrow \widetilde{K}_{0} \theta_{3} \wedge[\alpha]\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)
$$

If we apply again theorem 4.66 we obtain

$$
\vdash \tilde{K}_{0} \theta_{3} \wedge[a]\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right) \rightarrow[\alpha]\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)
$$

hence

$$
\vdash\left(K_{0} \theta_{1} \wedge \widetilde{K}_{0} \theta_{2} \wedge \widetilde{K}_{0} \theta_{3}\right) \rightarrow[\alpha]\left(\tilde{K}_{0} \theta_{3} \wedge \widetilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)
$$

As $c_{\mathcal{M}}=K_{0}\left(\bigvee_{Q \in \mathcal{M}} c_{Q}\right) \wedge\left(\bigwedge_{Q \in \mathcal{M}} \tilde{K}_{0} c_{Q}\right)$, we can use the same idea, applying theorem 4.66 once for each process in $\mathcal{M}$ (being finite) and we obtain

$$
\vdash c_{\mathcal{M}} \rightarrow[\alpha] c_{\mathcal{M}}
$$

Theorem 4.72. If $\mathcal{M}$ is a finite context then $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q} c_{\mathcal{M}}\right)$
Proof. Observe that, by applying axiom E20, we obtain

$$
\vdash K_{0} \theta_{1} \wedge \tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3} \rightarrow\left(\tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3}\right) \wedge\left(K_{Q} \top \rightarrow K_{Q} K_{0} \theta_{1}\right)
$$

If, further, we apply theorem 4.67 once, we obtain

$$
\begin{aligned}
& \vdash\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2}\right) \wedge\left(K_{Q} \top \rightarrow K_{Q} K_{0} \theta_{1}\right) \rightarrow \\
& \tilde{K}_{0} \theta_{3} \wedge\left(K_{Q} \top \rightarrow K_{Q} \tilde{K}_{0} \theta_{2}\right) \wedge\left(K_{Q} \top \rightarrow K_{Q} K_{0} \theta_{1}\right), \text { i.e. } \\
& \vdash\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2}\right) \wedge\left(K_{Q} \top \rightarrow K_{Q} K_{0} \theta_{1}\right) \rightarrow \tilde{K}_{0} \theta_{3} \wedge\left(K_{Q} \top \rightarrow\left(K_{Q} \tilde{K}_{0} \theta_{2} \wedge K_{Q} K_{0} \theta_{1}\right)\right)
\end{aligned}
$$

i.e., using 4.57,

$$
\vdash\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2}\right) \wedge\left(K_{Q} \top \rightarrow K_{Q} K_{0} \theta_{1}\right) \rightarrow \tilde{K}_{0} \theta_{3} \wedge\left(K_{Q} \top \rightarrow K_{Q}\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)\right)
$$

Hence

$$
\vdash\left(K_{0} \theta_{1} \wedge \tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3}\right) \rightarrow \tilde{K}_{0} \theta_{3} \wedge\left(K_{Q} \top \rightarrow K_{Q}\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)\right)
$$

If we apply again the theorems 4.67 and 4.57 we obtain

$$
\vdash\left[\tilde{K}_{0} \theta_{3} \wedge\left(K_{Q} \top \rightarrow K_{Q}\left(\tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)\right)\right] \rightarrow\left[K_{Q} \top \rightarrow K_{Q}\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)\right]
$$

hence

$$
\vdash\left(K_{0} \theta_{1} \wedge \tilde{K}_{0} \theta_{2} \wedge \tilde{K}_{0} \theta_{3}\right) \rightarrow\left[K_{Q} \top \rightarrow K_{Q}\left(\tilde{K}_{0} \theta_{3} \wedge \tilde{K}_{0} \theta_{2} \wedge K_{0} \theta_{1}\right)\right]
$$

Because $c_{\mathcal{M}}=K_{0}\left(\bigvee_{Q \in \mathcal{M}} c_{Q}\right) \wedge\left(\bigwedge_{Q \in \mathcal{M}} \tilde{K}_{0} c_{Q}\right)$, we can use the same idea, applying theorem 4.67 once for each process in $\mathcal{M}$ (being finite) and we obtain

$$
\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q} c_{\mathcal{M}}\right)
$$

Now we prove a context sensitive version of rule $E_{R} 1$.

Theorem 4.73. If $\mathcal{M}$ is a finite context and $\vdash c_{\mathcal{M}} \rightarrow(\phi \rightarrow \psi)$ then $\vdash c_{\mathcal{M}} \rightarrow(\phi|\rho \rightarrow \psi| \rho)$.
Proof. $\vdash c_{\mathcal{M}} \rightarrow(\phi \rightarrow \psi)$ implies $\vdash\left(c_{\mathcal{M}} \wedge \phi\right) \rightarrow \psi$ where we apply rule $\mathrm{E}_{R} 1$ and obtain $\vdash\left(c_{\mathcal{M}} \wedge \phi\right)|\rho \rightarrow \psi| \rho$. But theorem 4.70 gives $\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \rho\right) \rightarrow\left(c_{\mathcal{M}} \wedge \phi\right) \mid \rho$. Combining these two results we obtain
$\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \rho\right) \rightarrow \psi \mid \rho$, i.e. $\vdash c_{\mathcal{M}} \rightarrow(\phi|\rho \rightarrow \psi| \rho)$.
A context-sensitive version of theorem 4.49 is also available.

Theorem 4.74. If for a finite context $\mathcal{M} \ni P$ and any decomposition $P \equiv Q \mid R$ we have

$$
\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \rightarrow \neg \phi\right) \text { or } \vdash c_{\mathcal{M}} \rightarrow\left(c_{R} \rightarrow \neg \psi\right) \text { then } \vdash c_{\mathcal{M}} \rightarrow\left(c_{P} \rightarrow \neg(\phi \mid \psi)\right)
$$

Proof. If $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \rightarrow \neg \phi\right)$ then we have, equivalently, $\vdash c_{\mathcal{M}} \wedge c_{Q} \rightarrow \neg \phi$, i.e. $\vdash c_{Q} \rightarrow\left(c_{\mathcal{M}} \rightarrow\right.$ $\neg \phi)$, hence $\vdash c_{Q} \rightarrow \neg\left(c_{\mathcal{M}} \wedge \phi\right)$.
Similarly $\vdash c_{\mathcal{M}} \rightarrow\left(c_{R} \rightarrow \neg \psi\right)$ gives $\vdash c_{R} \rightarrow \neg\left(c_{\mathcal{M}} \wedge \psi\right)$.
Hence the hypothesis of the theorem can be rewritten as: for any decomposition $P \equiv Q \mid R$ we have

$$
\vdash c_{Q} \rightarrow \neg\left(c_{\mathcal{M}} \wedge \phi\right) \text { or } \vdash c_{R} \rightarrow \neg\left(c_{\mathcal{M}} \wedge \psi\right)
$$

Then we can apply theorem 4.49 and we obtain

$$
\begin{equation*}
\vdash c_{P} \rightarrow \neg\left(\left(c_{\mathcal{M}} \wedge \phi\right) \mid\left(c_{\mathcal{M}} \wedge \psi\right)\right) \tag{4.3}
\end{equation*}
$$

But theorem 4.69 entails $\vdash c_{\mathcal{M}} \wedge \phi\left|\psi \rightarrow\left(c_{\mathcal{M}} \wedge \phi\right)\right|\left(c_{\mathcal{M}} \wedge \psi\right)$, hence $\vdash \neg\left(\left(c_{\mathcal{M}} \wedge \phi\right) \mid\left(c_{\mathcal{M}} \wedge \psi\right)\right) \rightarrow$ $\neg\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right)$, and applying this result to (4.3), we obtain

$$
\vdash c_{P} \rightarrow \neg\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right) \text { that is equivalent with } \vdash c_{\mathcal{M}} \rightarrow\left(c_{P} \rightarrow \neg(\phi \mid \psi)\right)
$$

Further we prove a context-sensitive version of rule $\mathrm{E}_{R} 2$.

Theorem 4.75. If $\vdash c_{\mathcal{M}} \rightarrow \phi$ then $\vdash c_{\mathcal{M}} \rightarrow[\alpha] \phi$.
Proof. If we apply rule $\mathrm{E}_{R} 2$ to $\vdash c_{\mathcal{M}} \rightarrow \phi$ we obtain $\vdash[\alpha]\left(c_{\mathcal{M}} \rightarrow \phi\right)$. But axiom E8 gives $\vdash[\alpha]\left(c_{\mathcal{M}} \rightarrow \phi\right) \rightarrow\left([\alpha] c_{\mathcal{M}} \rightarrow[\alpha] \phi\right)$, hence $\vdash[\alpha] c_{\mathcal{M}} \rightarrow[\alpha] \phi$. Theorem 4.71 proves that $\vdash c_{\mathcal{M}} \rightarrow$ $[\alpha] c_{\mathcal{M}}$ which gives further $\vdash c_{\mathcal{M}} \rightarrow[\alpha] \phi$.

The next result is a context-sensitive variant of rule $\mathrm{E}_{R} 5$.

Theorem 4.76. If $\vdash c_{\mathcal{M}} \rightarrow \phi$ then $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q} \phi\right)$.
Proof. If we apply rule $\mathrm{E}_{R} 5$ to $\vdash c_{\mathcal{M}} \rightarrow \phi$, we obtain

$$
\vdash K_{Q} \top \rightarrow K_{Q}\left(c_{\mathcal{M}} \rightarrow \phi\right)
$$

But axiom E13 gives further $\vdash K_{Q}\left(c_{\mathcal{M}} \rightarrow \phi\right) \rightarrow\left(K_{Q} c_{\mathcal{M}} \rightarrow K_{Q} \phi\right)$. Hence $\vdash K_{Q} \top \wedge K_{Q} c_{\mathcal{M}} \rightarrow$ $K_{Q} \phi$ that is equivalent with

$$
\vdash K_{Q} c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q} \phi\right)
$$

Now, theorem 4.72 ensures that $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q} c_{\mathcal{M}}\right)$.
Hence $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q} \phi\right)$.
Theorem 4.77. If $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \psi \rightarrow \phi\right)$ then $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \psi \rightarrow K_{Q} \phi\right)$.
Proof. We apply theorem 4.76 to $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \psi \rightarrow \phi\right)$ and we obtain $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q}\left(K_{Q} \psi \rightarrow \phi\right)\right)$, i.e. $\vdash\left(c_{\mathcal{M}} \wedge K_{Q} \top\right) \rightarrow K_{Q}\left(K_{Q} \psi \rightarrow \phi\right)$.
But axiom E13 gives $\vdash K_{Q}\left(K_{Q} \psi \rightarrow \phi\right) \rightarrow\left(K_{Q} K_{Q} \psi \rightarrow K_{Q} \phi\right)$. Now if we use theorem 4.58 we obtain further

$$
\vdash K_{Q}\left(K_{Q} \psi \rightarrow \phi\right) \rightarrow\left(K_{Q} \psi \rightarrow K_{Q} \phi\right)
$$

All these proved that $\vdash\left(c_{\mathcal{M}} \wedge K_{Q} \top\right) \rightarrow\left(K_{Q} \psi \rightarrow K_{Q} \phi\right)$, i.e.

$$
\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow\left(K_{Q} \psi \rightarrow K_{Q} \phi\right)\right)
$$

which is equivalent with $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \wedge K_{Q} \psi \rightarrow K_{Q} \phi\right)$.
Theorem 4.56 proved that $\vdash K_{Q} \psi \rightarrow K_{Q} \top$, result which, combined with the previous one, gives further $\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \psi \rightarrow K_{Q} \phi\right)$.

Theorem 4.78. If $Q \mid R \in \mathcal{M}$ then $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow \neg \phi\right)$ implies $\vdash c_{\mathcal{M}} \rightarrow \neg K_{Q} \phi$.
Proof. Because $\vdash c_{R} \rightarrow \top$, rule $\mathrm{E}_{R} 1$ gives $\vdash c_{Q}\left|c_{R} \rightarrow c_{Q}\right| \top$ that gives further $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow\right.$ $\left.c_{Q} \mid \top\right)$. Combining this result with the hypothesis of the theorem, $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow \neg \phi\right)$, we obtain

$$
\vdash\left(c_{\mathcal{M}} \wedge c_{Q} \mid c_{R}\right) \rightarrow\left(c_{Q} \mid \top \wedge \neg \phi\right) \text {, i.e. } \vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow\left(c_{Q} \mid \top \wedge \neg \phi\right)\right)
$$

But $\vdash\left(c_{Q} \mid \top \wedge \neg \phi\right) \leftrightarrow \neg\left(c_{Q} \mid \top \rightarrow \phi\right)$, hence

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow \neg\left(c_{Q} \mid \top \rightarrow \phi\right)\right) \tag{4.4}
\end{equation*}
$$

Axiom E14 ensure that $\vdash K_{0}\left(c_{Q} \mid \top \rightarrow \phi\right) \rightarrow\left(c_{Q} \mid \top \rightarrow \phi\right)$ or, equivalently, $\vdash \neg\left(c_{Q} \mid \top \rightarrow \phi\right) \rightarrow$ $\neg K_{0}\left(\left.c_{Q}\right|^{\top} \rightarrow \phi\right)$, that, used in (4.4) gives

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow \neg K_{0}\left(\left.c_{Q}\right|^{\top} \rightarrow \phi\right)\right) \tag{4.5}
\end{equation*}
$$

But theorem 4.55 gives $\vdash K_{0} \top$, that can be used in (4.5) providing

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow\left(K_{0} \top \wedge \neg K_{0}\left(c_{Q} \mid \top \rightarrow \phi\right)\right)\right) \tag{4.6}
\end{equation*}
$$

The negative introspection, axiom E16, infers

$$
\begin{equation*}
\vdash\left(K_{0} \top \wedge \neg K_{0}\left(c_{Q} \mid \top \rightarrow \phi\right)\right) \rightarrow K_{0} \neg K_{0}\left(c_{Q} \mid \top \rightarrow \phi\right) \tag{4.7}
\end{equation*}
$$

Combining (4.6) and (4.7) we obtain

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \mid c_{R} \rightarrow K_{0} \neg K_{0}\left(c_{Q} \mid \top \rightarrow \phi\right)\right) \tag{4.8}
\end{equation*}
$$

But (4.8) is equivalent with $\vdash\left(c_{\mathcal{M}} \wedge c_{Q} \mid c_{R}\right) \rightarrow K_{0} \neg K_{0}\left(c_{Q} \mid \top \rightarrow \phi\right)$, and because $Q \mid R \in \mathcal{M}$, we can apply rule $\mathrm{E}_{R} 6$ and obtain

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \rightarrow \neg K_{0}\left(K_{Q} \top \rightarrow \phi\right) \tag{4.9}
\end{equation*}
$$

But from axiom E17 we derive $\vdash K_{Q} \phi \rightarrow K_{0}\left(K_{Q} \top \rightarrow \phi\right)$, hence

$$
\begin{equation*}
\vdash \neg K_{0}\left(K_{Q} \top \rightarrow \phi\right) \rightarrow \neg K_{Q} \phi \tag{4.10}
\end{equation*}
$$

Combining (4.9) with (4.10) we obtain $\vdash c_{\mathcal{M}} \rightarrow \neg K_{Q} \phi$, q.e.d.
The next result is a context-sensitive version of theorem 4.48.
Theorem 4.79. If $\vdash c_{\mathcal{M}} \rightarrow(\phi \rightarrow \psi)$ and $\vdash c_{\mathcal{M}} \rightarrow(\rho \rightarrow \theta)$ then $\vdash c_{\mathcal{M}} \rightarrow(\phi|\rho \rightarrow \psi| \theta)$.
Proof. To $\vdash c_{\mathcal{M}} \rightarrow(\phi \rightarrow \psi)$ we can apply theorem 4.73 and we obtain $\vdash c_{\mathcal{M}} \rightarrow(\phi|\rho \rightarrow \psi| \rho)$, i.e. $\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \rho\right) \rightarrow \psi \mid \rho$ which implies

$$
\begin{equation*}
\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \rho\right) \rightarrow\left(c_{\mathcal{M}} \wedge \psi \mid \rho\right) \tag{4.11}
\end{equation*}
$$

The same theorem 4.73 can be applied to $\vdash c_{\mathcal{M}} \rightarrow(\rho \rightarrow \theta)$ giving $\vdash c_{\mathcal{M}} \rightarrow(\psi|\rho \rightarrow \psi| \theta)$, i.e.

$$
\begin{equation*}
\vdash\left(c_{\mathcal{M}} \wedge \psi \mid \rho\right) \rightarrow \psi \mid \theta \tag{4.12}
\end{equation*}
$$

Further, combining (4.11) and (4.12) we derive $\vdash\left(c_{\mathcal{M}} \wedge \phi \mid \psi\right) \rightarrow \psi \mid \theta$, hence $\vdash c_{\mathcal{M}} \rightarrow(\phi \mid \psi \rightarrow$ $\psi \mid \theta)$.

We prove further a contextual version of theorem 4.50.
Theorem 4.80. If $\vdash c_{\mathcal{M}} \rightarrow(\phi \rightarrow \psi)$ then $\vdash c_{\mathcal{M}} \rightarrow(\langle\alpha\rangle \phi \rightarrow\langle\alpha\rangle \psi)$.
Proof. $\vdash c_{\mathcal{M}} \rightarrow(\phi \rightarrow \psi)$ implies $\vdash c_{\mathcal{M}} \rightarrow(\neg \psi \rightarrow \neg \phi)$ where, applying theorem 4.75, we obtain $\vdash c_{\mathcal{M}} \rightarrow[\alpha](\neg \psi \rightarrow \neg \phi)$. But axiom E8 gives $\vdash[\alpha](\neg \psi \rightarrow \neg \phi) \rightarrow([\alpha] \neg \psi \rightarrow[\alpha] \neg \phi)$. Hence $\vdash c_{\mathcal{M}} \rightarrow([\alpha] \neg \psi \rightarrow[\alpha] \neg \phi)$, i.e. $\vdash c_{\mathcal{M}} \rightarrow(\neg\langle\alpha\rangle \psi \rightarrow \neg\langle\alpha\rangle \phi)$. Concluding, $\vdash c_{\mathcal{M}} \rightarrow(\langle\alpha\rangle \phi \rightarrow$ $\langle\alpha\rangle \psi)$.

The next result is a variant of theorem 4.54, but sensitive to the context.
Theorem 4.81.

$$
\text { If } \vdash c_{\mathcal{M}} \rightarrow\left(\bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \phi\right) \text { then } \vdash c_{\mathcal{M}} \rightarrow\left(c_{P} \rightarrow[\alpha] \phi\right)
$$

Proof. If $\vdash c_{\mathcal{M}} \rightarrow\left(\bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \phi\right)$ then theorem 4.75 gives $\vdash c_{\mathcal{M}} \rightarrow[\alpha]\left(\bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha}\right.\right.$ $Q\} \rightarrow \phi)$ and further axiom E8 gives

$$
\vdash c_{\mathcal{M}} \rightarrow\left([\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow[\alpha] \phi\right)
$$

But theorem 4.53 gives

$$
\vdash c_{P} \rightarrow[\alpha] \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\}
$$

hence $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow[\alpha] \phi$, i.e. $\vdash c_{\mathcal{M}} \rightarrow\left(c_{P} \rightarrow[\alpha] \phi\right)$.

### 4.9 Completeness of $\mathcal{L}_{D E S}^{\mathscr{S}}$ against process semantics

Now we will prove the completeness of $\mathcal{L}_{D E S}^{\mathscr{S}}$ with respect to process semantics. We recall that completeness ensures that everything that can be derived in the semantics can be proved in the syntax. In this way we have the possibility to syntactically verify properties.

In the context of a decidable system, as ours is, the completeness provides a powerful tool for making predictions on the evolution of the system we analyze. Indeed, knowing the state of our system, we can characterize it syntactically. And because any other state can be characterized, we can project our problem into the syntax and verify its satisfiability. Hence if our system can reach that state, we will obtain that the formula is satisfiable and the method will provide also a minimal model that satisfies it. Thus we made a prediction without investigating (simulating) the full evolution of the system that might cause, sometimes, unsolvable computational problems (usually the time is branching generating exponential complexity).

We start by proving a lemma that provides a syntactic characterization of the satisfiability. The intuition is that, because $c_{P}$ and $c_{\mathcal{M}}$ are characteristic formulas, we should have an equivalence between $\mathcal{M}, P \models \phi$ and $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$ (of course for finite contexts) as both can be read as the process $P$ in the context $\mathcal{M}$ has the property $\phi$.

Lemma 4.82. If $\mathcal{M}$ is a finite context then $\mathcal{M}, P \models \phi$ iff $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$.
Proof. $(\Longrightarrow)$ We prove it by induction on the syntactical structure of $\phi$.

- The case $\phi=0: \mathcal{M}, P \models 0$ implies $P \equiv 0$. But $c_{0}=0$ and $\vdash 0 \rightarrow 0$, hence $\vdash 0 \wedge c_{\mathcal{M}} \rightarrow 0$. This gives $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$.
- The case $\phi=\top$ : we have always $\mathcal{M}, P \models \top$ and $\vdash c_{P} \wedge c_{\mathcal{M}} \rightarrow \top$, hence $\vdash c_{P} \wedge c_{\mathcal{M}} \rightarrow \phi$.
- The case $\phi=\phi_{1} \wedge \phi_{2}: \mathcal{M}, P \models \phi$ iff $\mathcal{M}, P \models \phi_{1}$ and $\mathcal{M}, P \models \phi_{2}$.

Further, using the inductive hypothesis, we obtain $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi_{1}$ and $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi_{2}$. Hence $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow\left(\phi_{1} \wedge \phi_{2}\right)$, i.e. $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$.

- The case $\phi=\phi_{1} \mid \phi_{2}$ : $\mathcal{M}, P \models \phi$ iff $P \equiv Q \mid R, \mathcal{M}, Q \models \phi_{1}$ and $\mathcal{M}, R \models \phi_{2}$.

Using the inductive hypothesis,
$\vdash c_{\mathcal{M}} \wedge c_{Q} \rightarrow \phi_{1}$ and $\vdash c_{\mathcal{M}} \wedge c_{R} \rightarrow \phi_{2}$, i.e.
$\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \rightarrow \phi_{1}\right)$ and $\vdash c_{\mathcal{M}} \rightarrow\left(c_{R} \rightarrow \phi_{2}\right)$.
Hence, using theorem 4.79 we obtain $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q}\left|c_{R} \rightarrow \phi_{1}\right| \phi_{2}\right)$, i.e. $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$.

- The case $\phi=K_{Q} \top: \mathcal{M}, P \models K_{Q} \top$ iff $P \equiv Q \mid R$, iff $c_{P}=c_{Q} \mid c_{R}$. Using rule $\mathrm{E}_{R} 1$ we obtain $\vdash c_{Q}\left|c_{R} \rightarrow c_{Q}\right| \top$, further using axiom $\mathrm{E} 12 \vdash c_{Q} \mid c_{R} \rightarrow K_{Q} \top$, i.e. $\vdash c_{P} \rightarrow K_{Q} \top$. Hence $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$.
- The case $\phi=K_{Q} \psi: \mathcal{M}, P \models K_{Q} \psi$, and because $\vdash K_{Q} \psi \rightarrow K_{Q} \top$ (by theorem 4.56), using the soundness, we obtain that $\mathcal{M}, P \models K_{Q} \top$. Now, we apply the previous case that gives

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow K_{Q} \top \tag{4.13}
\end{equation*}
$$

$\mathcal{M}, P \models K_{Q} \psi$ is equivalent with $P \equiv Q \mid R$ and for any $Q \mid S \in \mathcal{M}$ we have $\mathcal{M}, Q \mid S \models \psi$. Then the inductive hypothesis gives

$$
\begin{equation*}
\text { for any } Q \mid S \in \mathcal{M} \text { we have } \vdash\left(c_{\mathcal{M}} \wedge c_{Q} \mid c_{S}\right) \rightarrow \psi \tag{4.14}
\end{equation*}
$$

Consider now a process $Q \mid S \notin \mathcal{M}$. Because $\mathcal{M}$ is finite, we apply theorem 4.68 and obtain $\vdash c_{\mathcal{M}} \rightarrow \neg\left(c_{Q} \mid c_{S}\right)$ or equivalent, $\vdash c_{\mathcal{M}} \wedge\left(c_{Q} \mid c_{S}\right) \rightarrow \perp$. But $\vdash \perp \rightarrow \psi$, hence

$$
\begin{equation*}
\text { for any } Q \mid S \notin \mathcal{M} \text { we have } \vdash\left(c_{\mathcal{M}} \wedge c_{Q} \mid c_{S}\right) \rightarrow \psi \tag{4.15}
\end{equation*}
$$

Now (4.14) and (4.15) together give

$$
\begin{equation*}
\text { for any } S \in \mathcal{M} \text { we have } \vdash\left(c_{\mathcal{M}} \wedge c_{Q} \mid c_{S}\right) \rightarrow \psi \tag{4.16}
\end{equation*}
$$

i.e., using theorem 4.46,

$$
\begin{equation*}
\vdash\left(c_{\mathcal{M}} \wedge c_{Q} \mid \bigvee_{S \in \mathcal{M}} c_{S}\right) \rightarrow \psi \tag{4.17}
\end{equation*}
$$

But

$$
\vdash K_{0}\left(\bigvee_{S \in \mathcal{M}} c_{S}\right) \rightarrow \bigvee_{S \in \mathcal{M}} c_{S}, \text { hence } \vdash c_{\mathcal{M}} \rightarrow \bigvee_{S \in \mathcal{M}} c_{S}
$$

Now, we can apply rule $\mathrm{E}_{R} 1$ and obtain

$$
\vdash c_{Q}\left|c_{\mathcal{M}} \rightarrow c_{Q}\right| \bigvee_{S \in \mathcal{M}} c_{S}, \text { hence } \vdash\left(c_{Q} \mid c_{\mathcal{M}} \wedge c_{\mathcal{M}}\right) \rightarrow\left(c_{Q} \mid \bigvee_{S \in \mathcal{M}} c_{S} \wedge c_{\mathcal{M}}\right)
$$

In this point, using (4.17) we obtain

$$
\begin{equation*}
\vdash\left(c_{Q} \mid c_{\mathcal{M}} \wedge c_{\mathcal{M}}\right) \rightarrow \psi \tag{4.18}
\end{equation*}
$$

We have $\vdash c_{\mathcal{M}} \rightarrow\left(\top \rightarrow c_{\mathcal{M}}\right)$ and $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \rightarrow c_{Q}\right)$ where from, applying theorem 4.73, we can derive $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q}\left|\top \rightarrow c_{Q}\right| c_{\mathcal{M}}\right)$, i.e. $\vdash c_{M} \wedge c_{Q}\left|\top \rightarrow c_{Q}\right| c_{\mathcal{M}}$ and further

$$
\vdash\left(c_{M} \wedge c_{Q} \mid \top\right) \rightarrow\left(c_{\mathcal{M}} \wedge c_{Q} \mid c_{\mathcal{M}}\right)
$$

Using this result together with (4.18), we obtain further

$$
\vdash\left(c_{M} \wedge c_{Q} \mid \top\right) \rightarrow \psi \text {, i.e. } \vdash c_{M} \rightarrow\left(c_{Q} \mid \top \rightarrow \psi\right)
$$

where we can apply axiom E12 that gives

$$
\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow \psi\right)
$$

applying theorem 4.77, we obtain

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \rightarrow\left(K_{Q} \top \rightarrow K_{Q} \psi\right), \text { i.e. } \vdash\left(c_{\mathcal{M}} \wedge K_{Q} \top\right) \rightarrow K_{Q} \psi \tag{4.19}
\end{equation*}
$$

But (4.13) gives

$$
\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow K_{Q} \top \text { where from } \vdash\left(c_{\mathcal{M}} \wedge c_{P}\right) \rightarrow\left(c_{\mathcal{M}} \wedge K_{Q} \top\right)
$$

and using this in (4.19),

$$
\vdash\left(c_{\mathcal{M}} \wedge c_{P}\right) \rightarrow K_{Q} \psi \text { i.e. } \vdash\left(c_{\mathcal{M}} \wedge c_{P}\right) \rightarrow \phi
$$

- The case $\phi=\langle\alpha\rangle \psi: \mathcal{M}, P \models\langle\alpha\rangle \psi$ means that exists $P^{\prime} \in \mathcal{M}$ such that $P \xrightarrow{\alpha} P^{\prime}$ and $\mathcal{M}, P^{\prime} \models \psi$. Then the inductive hypothesis gives

$$
\vdash c_{\mathcal{M}} \wedge c_{P^{\prime}} \rightarrow \psi
$$

$P \xrightarrow{\alpha} P^{\prime}$ means that $P \equiv \alpha . R \mid S$ and $P^{\prime} \equiv R \mid S$, so $c_{P}=\left(\langle\alpha\rangle c_{R} \wedge 1\right) \mid c_{S}$ and $c_{P^{\prime}}=c_{R} \mid c_{S}$. So $\vdash c_{\mathcal{M}} \wedge c_{R} \mid c_{S} \rightarrow \psi$, i.e. $\vdash c_{\mathcal{M}} \rightarrow\left(c_{R} \mid c_{S} \rightarrow \psi\right)$ and using theorem 4.80

$$
\begin{equation*}
\vdash c_{\mathcal{M}} \rightarrow\left(\langle\alpha\rangle\left(c_{R} \mid c_{S}\right) \rightarrow\langle\alpha\rangle \psi\right) \tag{4.20}
\end{equation*}
$$

theorem 4.47 gives $\vdash c_{P} \rightarrow\langle\alpha\rangle c_{R}\left|c_{S} \wedge 1\right| c_{S}$, hence

$$
\begin{equation*}
\vdash c_{P} \rightarrow\langle\alpha\rangle c_{R} \mid c_{S} \tag{4.21}
\end{equation*}
$$

Axiom E7 gives

$$
\begin{equation*}
\vdash\langle\alpha\rangle c_{R} \mid c_{S} \rightarrow\langle\alpha\rangle\left(c_{R} \mid c_{S}\right) \tag{4.22}
\end{equation*}
$$

Hence, from (4.20), (4.21) and (4.22) we derive

$$
\vdash c_{\mathcal{M}} \rightarrow\left(c_{P} \rightarrow\langle\alpha\rangle \psi\right), \text { i.e. } \vdash\left(c_{\mathcal{M}} \wedge c_{P}\right) \rightarrow\langle\alpha\rangle \psi
$$

- The case $\phi=\neg \psi$ : we argue by induction on the syntactical structure of $\psi$.
- the subcase $\psi=0: \mathcal{M}, P \models \neg 0$ means that $P \not \equiv 0$. Then we can apply theorem 4.37 and obtain $\vdash c_{P} \rightarrow \neg 0$.

So $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg 0$.

- the subcase $\psi=\top$ : is an impossible one as we cannot have $\mathcal{M}, P \models \perp$.
- the subcase $\psi=\psi_{1} \wedge \psi_{2}: \mathcal{M}, P \models \neg\left(\psi_{1} \wedge \psi_{2}\right)$ is equivalent with $\mathcal{M}, P \models \neg \psi_{1} \vee \neg \psi_{2}$, i.e. $\mathcal{M}, P \models \neg \psi_{1}$ or $\mathcal{M}, P \models \neg \psi_{2}$. By the inductive hypothesis, $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg \psi_{1}$ or $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg \psi_{2}$, where from we obtain $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \psi$
- the subcase $\psi=\neg \psi_{1}: \mathcal{M}, P \models \neg \psi$ is equivalent with $\mathcal{M}, P \models \neg \neg \psi_{1}$, i.e. $\mathcal{M}, P \models$ $\psi_{1}$ where we can use the inductive hypothesis $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \psi_{1}$ which is equivalent with $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$.
- the subcase $\psi=\psi_{1} \mid \psi_{2}: \mathcal{M}, P \models \neg\left(\psi_{1} \mid \psi_{2}\right)$ means that for any parallel decomposition of $P \equiv Q \mid R, \mathcal{M}, Q \models \neg \psi_{1}$ or $\mathcal{M}, R \models \neg \psi_{2}$. These imply, using the inductive hypothesis, that for any decomposition $P \equiv Q \mid R$ we have

$$
\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \rightarrow \neg \psi_{1}\right) \text { or } \vdash c_{\mathcal{M}} \rightarrow\left(c_{R} \rightarrow \neg \psi_{2}\right)
$$

then we can apply theorem 4.74 that gives

$$
\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg \psi
$$

- the subcase $\psi=K_{0} \psi_{1}: \mathcal{M}, P \models \neg K_{0} \psi_{1}$ means $\exists R \in \mathcal{M}$ such that $\mathcal{M}, R \models \neg \psi_{1}$. Using the inductive hypothesis,
$\vdash c_{\mathcal{M}} \wedge c_{R} \rightarrow \neg \psi_{1}$, i.e. $\vdash c_{\mathcal{M}} \rightarrow\left(c_{R} \mid c_{0} \rightarrow \neg \psi_{1}\right)$. Now theorem 4.78 gives $\vdash c_{\mathcal{M}} \rightarrow$ $\neg K_{0} \psi_{1}$, hence $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg K_{0} \psi_{1}$.
- the subcase $\psi=K_{Q} \psi_{1}, Q \not \equiv 0$ : we distinguish two cases
* the sub-subcase $\psi_{1}=\top: \mathcal{M}, P \models \neg K_{Q} \top$ implies that $Q$ is not a subprocess of $P$. Then for any $R \in \mathcal{M}$ we have $P \not \equiv Q \mid R$. Then theorem 4.37 gives us $\vdash c_{Q \mid R} \rightarrow \neg c_{P}$, i.e. $\vdash c_{Q} \mid c_{R} \rightarrow \neg c_{P}$. From here we can infer

$$
\begin{equation*}
\vdash c_{Q} \mid \bigvee_{S \in \mathcal{M}} c_{S} \rightarrow \neg c_{P} \tag{4.23}
\end{equation*}
$$

But

$$
\vdash K_{0}\left(\bigvee_{S \in \mathcal{M}} c_{S}\right) \rightarrow \bigvee_{S \in \mathcal{M}} c_{S}, \text { hence } \vdash c_{\mathcal{M}} \rightarrow \bigvee_{S \in \mathcal{M}} c_{S}
$$

Now, we can apply rule $\mathrm{E}_{R} 1$ and obtain

$$
\vdash c_{Q}\left|c_{\mathcal{M}} \rightarrow c_{Q}\right| \bigvee_{S \in \mathcal{M}} c_{S}
$$

In this point, using (4.23) we obtain

$$
\begin{equation*}
\vdash c_{Q} \mid c_{\mathcal{M}} \rightarrow \neg c_{P} \tag{4.24}
\end{equation*}
$$

We have $\vdash c_{\mathcal{M}} \rightarrow\left(\top \rightarrow c_{\mathcal{M}}\right)$ and $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q} \rightarrow c_{Q}\right)$ where from, applying theorem 4.73, we can derive $\vdash c_{\mathcal{M}} \rightarrow\left(c_{Q}\left|\top \rightarrow c_{Q}\right| c_{\mathcal{M}}\right)$, i.e. $\vdash c_{M} \wedge c_{Q} \mid \top \rightarrow$ $c_{Q} \mid c_{\mathcal{M}}$ Using this result together with (4.24), we obtain further

$$
\vdash\left(c_{M} \wedge c_{Q} \mid \top\right) \rightarrow \neg c_{P}, \text { i.e. } \vdash c_{M} \wedge c_{P} \rightarrow \neg\left(c_{Q} \mid \top\right)
$$

and axiom E12 gives

$$
\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg K_{Q} \top
$$

* the sub-subcase $\psi_{1} \neq \top$ : we distinguish two more cases $\mathcal{M}, P \models \neg K_{Q} \top$ and $\mathcal{M}, P \models K_{Q} \top$.
- if $\mathcal{M}, P \models \neg K_{Q} \psi_{1}$ and $\mathcal{M}, P \models \neg K_{Q} \top$, we have
$\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg K_{Q} \top$ (proved before). Moreover, because $\vdash K_{Q} \psi_{1} \rightarrow K_{Q} \top$ (theorem 4.56) we have
$\vdash \neg K_{Q} \top \rightarrow \neg K_{Q} \psi_{1}$ which gives $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg K_{Q} \psi_{1}$.
. if $\mathcal{M}, P \models \neg K_{Q} \psi_{1}$ and $\mathcal{M}, P \models K_{Q} \top, \exists Q \mid S \in \mathcal{M}$ with $\mathcal{M}, S \mid Q \vDash \neg \psi_{1}$.
Using the inductive hypothesis we obtain $\vdash c_{\mathcal{M}} \rightarrow\left(c_{S} \mid c_{Q} \rightarrow \neg \psi_{1}\right)$ and from theorem 4.78 that $\vdash c_{\mathcal{M}} \rightarrow \neg K_{Q} \psi_{1}$. Hence $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg K_{Q} \psi_{1}$.
- the subcase $\psi=\langle\alpha\rangle \psi_{1}: \mathcal{M}, P \models \neg\langle\alpha\rangle \psi_{1}$ is equivalent with $\mathcal{M}, P \models[\alpha] \neg \psi_{1}$.

If there is a process $Q \in \mathcal{M}$ such that $P \xrightarrow{\alpha} Q$, then for any $Q \in \mathcal{M}$ such that $P \xrightarrow{\alpha} Q$ we have $\mathcal{M}, Q \models \neg \psi_{1}$. Using the inductive hypothesis we obtain that for any $Q \in \mathcal{M}$ such that $P \xrightarrow{\alpha} Q$ we have $\vdash c_{\mathcal{M}} \wedge c_{Q} \rightarrow \neg \psi_{1}$, i.e.

$$
\vdash c_{\mathcal{M}} \wedge \bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \neg \psi_{1}
$$

or equivalently

$$
\vdash c_{\mathcal{M}} \rightarrow\left(\bigvee\left\{c_{Q} \mid P \xrightarrow{\alpha} Q\right\} \rightarrow \neg \psi_{1}\right)
$$

Using theorem 4.81, we obtain $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow[\alpha] \neg \psi_{1}$.
If there is no process $Q \in \mathcal{M}$ such that $P \xrightarrow{\alpha} Q$ then theorem 4.52 gives $\vdash c_{P} \rightarrow$ $[\alpha] \perp$. But $\vdash \psi_{1} \rightarrow \top$, hence $\vdash[\alpha] \perp \rightarrow[\alpha] \neg \psi_{1}$. So, also in this case we have $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow[\alpha] \neg \psi_{1}$.
$(\Longleftarrow)$ Let $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \phi$. Suppose that $\mathcal{M}, P \not \vDash \phi$. Then $\mathcal{M}, P \vDash \neg \phi$. Using the reversed implication we obtain $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg \phi$, thus
$\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \perp$. But from corollary 4.40 we have $\mathcal{M}, P \models c_{\mathcal{M}} \wedge c_{P}$ which, using the soundness, gives $\mathcal{M}, P \neq \perp$ impossible!
Hence $\mathcal{M}, P \models \phi$.
We recall the definitions of provability, consistency, satisfiability and validity.

Definition 4.11 (Provability and consistency). We say that a formula $\phi \in \mathcal{F}_{D E S}^{\mathscr{S}}$ is provable in $\mathcal{L}_{D E S}^{\mathscr{G}}$ (or $\mathcal{L}_{D E S}^{\mathscr{S}}$-provable for short), if $\phi$ can be derived, as a theorem, using the axioms and the rules of $\mathcal{L}_{D E S}^{\mathcal{S}}$. We denote this by $\vdash \phi$.
We say that a formula $\phi \in \mathcal{F}_{D E S}^{\mathcal{S}}$ is consistent in $\mathcal{L}_{D E S}^{\mathcal{S}}$ (or $\mathcal{L}_{D E S}^{\mathcal{S}}$-consistent for short) if $\neg \phi$ is not $\mathcal{L}_{D E S}^{\mathfrak{S}}$-provable.

Definition 4.12 (Satisfiability and validity). We call a formula $\phi \in \mathcal{F}_{D E S}^{\mathscr{G}}$ satisfiable if there exists a context $\mathcal{M}$ and a process $P \in \mathcal{M}$ such that $\mathcal{M}, P \models \phi$.
We call a formula $\phi \in \mathcal{F}_{D E S}^{\mathscr{S}}$ validity if for any context $\mathcal{M}$ and any process $P \in \mathcal{M}$ we have $\mathcal{M}, P \models \phi$. In such a situation we write $\models \phi$.
Given a context $\mathcal{M}$, we denote by $\mathcal{M} \models \phi$ the situation when for any $P \in \mathcal{M}$ we have $\mathcal{M}, P \models \phi$.
Remark 4.3. $\phi$ is satisfiable iff $\neg \phi$ is not a validity, and vice versa, $\phi$ is a validity iff $\neg \phi$ is not satisfiable.

Lemma 4.83. If $\phi$ is $\mathcal{L}_{D E S}^{\mathfrak{G}}$-consistent then exists a context $\mathcal{M}$ and a process $P \in \mathcal{M}$ such that $\mathcal{M}, P \models \phi$.

Proof. Suppose that for any context $\mathcal{M}$ and any process $P \in \mathcal{M}$ we do not have $\mathcal{M}, P \models \phi$, i.e. we have $\mathcal{M}, P \models \neg \phi$. Hence, for any finite context $\mathcal{M}$ and any process $P \in \mathcal{M}$ we have $\mathcal{M}, P \models \neg \phi$. Using lemma 4.82, we obtain $\vdash c_{\mathcal{M}} \wedge c_{P} \rightarrow \neg \phi$. Hence $\vdash c_{\mathcal{M}} \wedge \bigvee_{P \in \mathcal{M}} c_{P} \rightarrow \neg \phi$. But $\vdash c_{\mathcal{M}} \rightarrow \bigvee_{P \in \mathcal{M}} c_{P}$ which, combined with the previous result, implies $\vdash c_{\mathcal{M}} \rightarrow \neg \phi$.
Thus for each finite context $\mathcal{M}$ we have $\vdash c_{\mathcal{M}} \rightarrow \neg \phi$. But then for each context $\mathcal{M} \in \mathfrak{M}_{0 \neg \phi)}^{\text {act }(\neg \phi)_{+}}$ we have $\vdash c_{\mathcal{M}} \rightarrow \neg \phi$. As $\mathfrak{M}_{0 \neg \phi)}^{a c t(\neg \phi)_{+}}$is finite, we can infer further $\vdash \bigvee_{\mathcal{M} \in \mathfrak{M}_{0 \rightarrow \phi D}^{a c t(\neg \phi)+}} c_{\mathcal{M}} \rightarrow \neg \phi$. Now, applying rule $\mathrm{E}_{R} 4$, we obtain $\vdash \neg \phi$. This contradicts with the hypothesis of consistency of $\phi$. Hence, it exists a context $\mathcal{M}$ and a process $P \in \mathcal{M}$ such that $\mathcal{M}, P \models \phi$.

Theorem 4.84 (Completeness). The $\mathcal{L}_{D E S}^{\mathscr{G}}$ system is complete with respect to process semantics.

Proof. Suppose that $\phi$ is a valid formula with respect to our semantics, but $\phi$ is not provable in the system $\mathcal{L}_{D E S}^{\mathscr{G}}$. Then neither is $\neg \neg \phi$, so, by definition, $\neg \phi$ is $\mathcal{L}_{D E S}^{\mathcal{G}}$-consistent. It follows, from lemma 4.83 , that $\neg \phi$ is satisfiable with respect to process semantics, contradicting the validity of $\phi$.

## 5 Concluding remarks

In this paper we developed Dynamic Epistemic Spatial Logic, $\mathcal{L}_{D E S}^{\mathscr{S}}$, which extends HennessyMilner logic with the parallel operator and with epistemic operators. The lasts are meant to express global properties over contexts. We propose these operators as alternative to the guarantee operator of the classical spatial logics, in order to obtaining a logic adequately expressive and decidable.

Obviously Dynamic Epistemic Spatial Logic is more expressive than guarantee-free Dynamic Spatial Logic as the first can express global properties. Still our logic is less expressive than the classic spatial logic. Indeed, using the guarantee operator and the characteristic formulas, we can express our epistemic operators in classic spatial logic, while guarantee operator cannot be expressed by using our logic:

$$
\left.K_{Q} \phi \stackrel{\text { def }}{=} c_{Q}\right|^{\top} \wedge\left(\neg\left(c_{Q} \mid \top \rightarrow \phi\right) \triangleright \perp\right)
$$

Still, as remarked in section 4.2 , validity and satisfiability in a model can be expressed in our syntax. Combining this feature with the possibility to characterize processes and finite contexts, we may argue on utility of our logic in most of the CCS-like applications for which classic spatial logic was proposed.

In the context of decidability, our sound and complete Hilbert-style axiomatic system provides a powerful tool for making predictions on the evolution of the concurrent distributed systems. Knowing the current state or a sub-state of a system, we can characterize it syntactically. And because any other state can be characterized, we can project any prediction-like problem into the syntax and verify its satisfiability. Hence if the system we considered can reach the state we check, we will obtain that the formula is satisfiable and this method will provide also a minimal model. Thus we can make predictions without investigating (simulating) the full evolution of the system that might cause, sometimes, unsolvable computational problems (usually the time is branching generating exponential complexity).

The axioms and rules considered are very similar to the classical axioms and rules in epistemic logic, and some derivable theorems state meaningful properties of epistemic agents. All these relates our logic with the classical epistemic/doxastic logics and focus the specifications on external observers as epistemic agents. This interpretation is consistent with the spirit of process algebras.

Further researches are to be considered such as adding a Gabbay-Pitts operator [20] for specify new names and adding location operators. Challenging will be also the perspective of adding recursion in semantics.

Acknowledgements. We thank to Alexandru Baltag for contributing with valuable comments, since the beginning, on the construction of this logic. Thanks also to Luca Cardelli for comments and related discussions. The name structural bisimulation was suggested to us by Gordon Plotkin.

[^1]:    ${ }^{1}$ This operator is characteristic for Ambient Logic [12], a special spatial logic developed for Ambient Calculus [11].
    ${ }^{2}$ We can, additionally, consider an involution on $\mathbb{A}$ that associate to each action $\alpha \in \mathbb{A}$ an action $\bar{\alpha} \in \mathbb{A}$, as usual in CCS, and also to take into consideration the silent action $\tau$. But all these represent just syntactic sugar, irrelevant from the point of view of the logic we discuss.

[^2]:    ${ }^{3}$ Such a situation is in the case of the set $\mathcal{M}=\{0, \alpha .0, \alpha . \alpha .0, \ldots, \alpha \ldots . \alpha .0, \ldots\}$.

[^3]:    ${ }^{4}$ Else we can replace $P^{\prime}, P^{\prime \prime}$ with $(h+1, w)$-related processes having the same $(h, w)$-normal forms

[^4]:    ${ }^{5}$ This construction is not necessarily unique.

[^5]:    ${ }^{6}$ We count the processes up to structural congruence.

[^6]:    ${ }^{7}$ We do not refer here on bound pruning only, but on any possible pruning of the syntactic tree.
    ${ }^{8}$ We consider also $\pi(P)$ defined up to structural congruence.

[^7]:    ${ }^{9}$ We insist on this aspect as some syntaxes of classical logic use 0 for denoting false. This is not our intention. We use $\perp$ to denote false.

[^8]:    ${ }^{10}$ The disjunction is considered up to logically-equivalent decompositions $\phi \leftrightarrow \phi_{1} \mid \phi_{2}$ that ensures the use of a finitary formula.

[^9]:    ${ }^{11}$ We consider defined, on the class of actions $\mathbb{A}$, a lexicographical order.
